;1808  .PAGE  MODULE REVISION HISTORY
;1809 ;*****************************************************************************
;1810 ;
;1811 ;
;1812 ; MODULE NAME: ESKAR3D
;1813 ;
;1814 ; CREATION DATE:  SEPTEMBER 1982
;1815 ; AUTHOR:  DAN GRIGORE
;1816 ;
;1817 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1818 ;
;1819 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1820 ;
;1821 ; -  WHAT CHANGE WAS MADE
;1822 ;
;1823 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1824 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1825 ;
;1826 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1827 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1828 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1829 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1830 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1831 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1832 ;    ESKAR3C.
;1833 ;
;1834 ; START OF REVISION HISTORY:
;1835 ;
;1836 ;  MODIFIED BY: PAUL HAKALA
;1837 ;
;1838 ; 1.0 06-DEC-82: ESKAR40 TEST 18E (Cpu Multi Trans Test)
;1839 ;    added a check for another MS780-E and
;1840 ;    test it if found.
;1841 ;
;1842 ;    ESKAR3D TEST 172  Enable the cache at the
;1843 ;    beginning of test to allow for looping
;1844 ;    on the entire section.
;1845 ;
;1846 ;    ESKAR3E Took out the '?  mark im message
;1847 ;    number 10. This is an illegal Character in
;1848 ;    radix 50 code message 'No memory cntrls found
;1849 ;    now works properly.
;1850 ;
;1851 ;    Did a major cleanup of all documentation in
;1852 ;    all modules.
;1853 ;
;1854 ;
;1855 ;
;1856 ;*****************************************************************************
;1857

;1858   .PAGE
;1859
```

```
            ;1860   .PAGE
            ;1861   .TOC " MICRO TRAP HANDLER AND LSI-MONITOR CALL ROUTINES"
            ;1862 ;*
            ;1863 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1864 ; WITH A NUMBER, AND LOADS THE D REGISTER WITH THE CONTENTS OF R[0F].
            ;1865 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1866 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1867 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1868 ;
            ;1869 ; FOR EXAMPLE: IF A TEST EXPECTED A  TB MISS  MICRO TRAP IT WOULD SET BIT
            ;1870 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1871 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1872 ; R[0F] AND DO A RETURN0.
            ;1873 ;
            ;1874 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1875 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1876 ; TO THE CONSOLE.
            ;1877 ;
            ;1878 ;-

;1807  .PAGE "MODULE REVISION HISTORY"
;1808 ;*****************************************************************************
;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR3E
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:
;1834 ;
;1835 ; MODIFIED BY: PAUL HAKALA
;1836 ;
;1837 ; 1.0 December 6,1982  Paul Hakala
;1838 ;    Modified message NUMBER 10 to
;1839 ;    print properly took out A "?" which
;1840 ;     is a illegal character for Radix 50
;1841 ;
;1842 ; 1.1 March 10, 1983  Paul Hakala
;1843 ;   Modified the GET.MEMORY.SIZE routine to calculate
;1844 ;   the correct memory address when 256k ram chips are
;1845 ;   present.
;1846 ;
;1847 ;
;1848 ;
;1849 ;
;1850 ;
;1851 ;*****************************************************************************
;1852 ;

            ;1853  .PAGE
            ;1854
            ;1855  .TOC " MICRO TRAP HANDLER AND LSI-MONITER CALL ROUTINES"
            ;1856  .TOC "   MICRO TRAP HANDLER"
            ;1857 ;*
            ;1858 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1859 ; WITH A NUMBER, AND LOADS THE D REGISTER WITH THE CONTENTS OF R[0F].
            ;1860 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1861 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1862 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1863 ;
            ;1864 ; FOR EXAMPLE: IF A TEST EXPECTED A "TB MISS" MICRO TRAP IT WOULD SET BIT
            ;1865 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1866 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1867 ; R[0F] AND DO A RETURN0.
            ;1868 ;
            ;1869 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1870 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1871 ; TO THE CONSOLE.
            ;1872 ;
            ;1873 ;-

;3208  .PAGE "TEST 17E COMMAND ADDRESS TEST"
;3209 ;*************************************************************
;3210 ;+
;3211 ; TEST 17E COMMAND ADDRESS TEST
;3212 ;
;3213 ; TEST DESCRIPTION:
;3214 ; THIS TEST DOES MCT REFERENCES TO NON-EXISTENT ADDRESSES
;3215 ; IN ORDER TO EXAMINE THE SILO AND CHECK THAT COMMAND ADDRESS
;3216 ; GOES OUT ON THE SBI PROPERLY FROM THE CPU.
;3217 ;
;3218 ; LOGIC DESCRIPTION:
;3219 ; LOGIC ON SBH AND SBL ARE CHECKED HERE
;3220 ; IF A DEVICE IS CORRUPTING THE SBI WITH BAD PARITY, OR
;3221 ; MULTIPLE TRANSMITTERS, IT WILL BE CAUGHT IN THIS TEST.
;3222 ; ALSO IF THE SBI IS MISCONFIGURED (AND A DEVICE ANSWERS)
;3223 ; IT WILL BE CAUGHT HERE AND THE NEXT 15 TESTS SHOULD BE RUN
;3224 ; TO REPORT WHAT DEVICES ARE AT WHAT TR LEVELS.
;3225 ;
;3226 ; DATA DESCRIPTION:
;3227 ; **SUBTESTS 1-4**
;3228 ;
;3229 ; EXPECTED SILO CONTENTS FOR COMMAND ADDRESS (C/A)
;3230 ; EXPECTED SILO CONTENTS FOR SECONDARY PATTERN (SEE NOTE)
;3231 ;  (THE NEXT 11 DATA WORDS ARE 11 LOCATIONS OF SILO)
;3232 ; ARB (SHOULD BE ZERO ELSE SOMEONE'S TR IS RAISED)
;3233 ; C/A (SEE BELOW FOR FUNCTION)
;3234 ; SECONDARY PATTERN
;3235 ; NO RESPONSE (ZERO)
;3236 ; ARB
;3237 ; C/A
;3238 ; SECONDARY PATTERN
;3239 ; NO RESPONSE
;3240 ; ARB
;3241 ; C/A
;3242 ; SECONDARY PATTERN
;3243 ; ID[FAULT] (ID ADRS:1B)
;3244 ; ID[SBI.ERR] (ID ADRS:19)
;3245 ;
;3246 ;
;3247 ; **SUBTEST 5** (ONLY ONE RETRY)
;3248 ;
;3249 ; EXPECTED SILO CONTENTS FOR COMMAND ADDRESS (READ.INT.SUM)
;3250 ; EXPECTED SILO CONTENTS FOR SECONDARY DATA PATTERN (HOLD)
;3251 ; ARB
;3252 ; C/A
;3253 ; HOLD
;3254 ; 9 WORDS OF ZERO
;3255 ; ID[FAULT] (ID ADRS:1B)
;3256 ; ID[SBI.ERR] (ID ADRS:19)
;3257 ;
;3258 ;  FUNCTIONS:
;3259 ;   SUBTEST 1 - READ.P
;3260 ;   SUBTEST 2 - WRITE.P
;3261 ;   SUBTEST 3 - LOCKREAD.P
;3262 ;   SUBTEST 4 - LOCKWRITE.P
```

```
            ;3263 ;   SUBTEST 5 - READ.INT.SUM
            ;3264 ;
            ;3265 ;  NOTE: SECONDARY PATTERNS ARE GENERATED ON:
            ;3266 ;   WRITE REFERENCES - WRITE DATA FOLLOWS
            ;3267 ;   INTERLOCK READ REFERENCES - SBI INTLK ASSERTED
            ;3268 ;   INTERRUPT SUMMARY READS - HOLD ASSERTED NEXT CYCLE
            ;3269 ;--

;3438  .PAGE "TEST 17F SBI NEXUS RESPONSE TEST"
;3439 ;*****************************************************************
;3440 ;++
;3441 ; TEST 17F SBI NEXUS RESPONSE TEST
;3442 ;
;3443 ; TEST DESCRIPTION:
;3444 ;
;3445 ;      THIS TEST LOOPS THROUGH TR LEVELS 0-F LOOKING FOR
;3446 ; A RESPONDING DEVICE (READ REFERENCES THAT DO NOT TIME OUT).
;3447 ; ONCE A DEVICE HAS BEEN FOUND, THE TEST DOES THE FOLLOWING:
;3448 ;  A. TYPE THE NAME OF THE DEVICE AND IT'S TR LEVEL
;3449 ;     TO THE CONSOLE.
;3450 ;     IF THE ADAPTER CODE BITS IN THE CONFIGURATION
;3451 ;     REGISTER ARE INCORRECT, 'UNKNOWN DEVICE AT TR XX
;3452 ;     WILL BE TYPED.
;3453 ;
;3454 ;  B. CHECK TO SEE IF AN INTERRUPT WAS ASSERTED ON THE
;3455 ;     REFERENCE.
;3456 ;     FLAGGED AS ERROR CODE 0.
;3457 ;
;3458 ;
;3459 ;  E. CHECK TO SEE THAT THE EEVICE TRANSMITTED THE PROPER
;3460 ;     TAG AND MASK BITS FOR THE READ DATA RESPONSE
;3461 ;   TAG<2:0>=0, MASK<3:0>=0
;3462 ;     FLAGGED AS ERROR CODE 1.
;3463 ;     MUST HAVE TRANSMITTED CPU ID, OR CPU WOULD HAVE
;3464 ;     TIMED OUT.
;3465 ;
;3466 ;  E. CHECK TO SEE THAT THE DEVICE ARBITRATED AT THE
;3467 ;     PROPER TR LEVEL AT THE PROPER TIME.
;3468 ;   READ DATA - 1, SILO <15:00>= 2**TR
;3469 ;     FLAGGED AS ERROR CODE 2.
;3470 ;
;3471 ;
;3472 ;  *. NOTE: IN ORDER TO GUARUNTEE THAT THE READ DATA
;3473 ;   RESPONSE APPEARS IN THE SILO, THE SILO IS LOCKED
;3474 ;   ON THE FIRST OCCURRENCE OF READ DATA TAG
;3475 ;   TO THE CPU.  GIVEN THAT A DEVICE MAY RESPOND
;3476 ;   WITH READ DATA UP TO 512 CYCLES FROM COMMAND
;3477 ;   ADDRESS, THE CYCLES CONTAINING COMMAND ADDRESS
;3478 ;   AND ACK MAY OR MAY NOT APPEAR IN THE ERROR DATA
;3479 ;
;3480 ; LOGIC DESCRIPTION:
;3481 ;
;3482 ; LOGIC ON SBL, SBH, TRS, AND THE RESPONDING DEVICE ARE ALL
;3483 ; CHECKED HERE.
;3484 ; KEEP IN MIND THAT ALL THE BITS IN THE SILO HAVE
;3485 ; NOT BEEN CHECKED IN THE ASSERTED ('1') STATE.
;3486 ;
;3487 ;
;3488 ; DATA DESCRIPTION:
;3489 ;
;3490 ; CONFIGURATION REGISTER ADDRESS OF RESPONDING DEVICE
;3491 ; CONTENTS OF THE CONFIGURATION REGISTER
;3492 ; ERROR CODE: (SEE TEST DESCRIPTION)

                ;3706 ;
                ;3707 ;TEST DESCRIPTION
                ;3708 ; THIS TEST CHECKS THAT THE TIMEOUT COUNTER LOADS AND INCREMENTS
                ;3709 ; CORRECTLY. A NONEXISTANT MEMORY LOCATION IS REFERENCED THUS
                ;3710 ; CAUSING A TIMEOUT TO OCCUR. THE INTERVAL COUNTER IS USED TO
                ;3711 ; COUNT THE CYCLES UNTIL THE TIMEOUT OCCURS. THE INTERVAL COUNTER
                ;3712 ; IS THEN CHEKED TO SEE THAT THE TIMEOUT OCCURRED APPROXIMATELY
                ;3713 ; 512 CYLCES AFTER THE REFERENCE. THE SBI ERROR REGISTER (ID 19)
                ;3714 ; IS THEN CHECKED TO SEE THAT THE TIMEOUT WAS LATCHED (BIT 12).
                ;3715 ; IF THE TIMEOUT WAS LATCHED CORRECTLY, THE REGISTER IS THEN WRITTEN
                ;3716 ; WITH THE VALUE ZERO AND CHECKED TO SEE THAT THE TIMEOUT DOES NOT
                ;3717 ; CLEAR. THE REGISTER IS THEN WRITTEN WITH BIT 12 SET TO SEE THAT
                ;3718 ; THE TIMEOUT CLEARS PROPERLY.
                ;3719 ;
                ;3720 ;LOGIC DESCRIPTION
                ;3721 ; THE TIMEOUT COUNTER ON SBLK AND ID 19 ON SBLM ARE TESTED.

;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR3F
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:

;1842
;1843  .TOC " Micro Trap Handler and LSI-11 Support Routines"
;1844  .TOC "   Micro Trap Handler"
;1845 ;++
;1846 ; FUNCTIONAL DESCRIPTION:
;1847 ;
;1848 ; This routine is responsible for 'catching' micro-traps
;1849 ; and reporting unexpected traps to the Monitor. Register R[0F]
;1850 ; contains the Trap-Expected Mask. If the specified bit is set in
;1851 ; the mask, the bit is cleared and a RETURN0 is made otherwise,
;1852 ; an error call is made.
;1853 ;
;1854 ; INPUT PARAMETERS:
;1855 ;
;1856 ; R[0F] - Expected Trap Mask
;1857 ;  Trap Code Function
;1858 ;  ---------      --------
;1859 ;       0  System Init
;1860 ;       1  Data Unaligned
;1861 ;       2  Cross Page
;1862 ;       3  TB Modify
;1863 ;       4  TB Protection
;1864 ;       6  TB Miss
;1865 ;       7  TB Parity
;1866 ;       8  Cache Parity
;1867 ;       9  Reserved Floating Operand
;1868 ;       C  Read Data Substitute
;1869 ;       D  Time out
;1870 ;       F  Control Store Parity Error
;1871 ;      10  Odd Address
;1872 ;
;1873 ; OUTPUT PARAMETERS:
;1874 ;
;1875 ; R[0F] - Mask bit is cleared.
;1876 ;
;1877 ; DATA: Micro PC of Micro Trap

;2265  .PAGE
;2266  .TOC "   START TEST"
;2267 ;*************************************************************
;2268 ;**
;2269 ;
;2270 ; Functional Description:
;2271 ; ---------------------
;2272 ;
;2273 ;         This subroutine will be called by all tests that  check  the
;2274 ;    controllers,  or  those  tests  that  have  to switch between the
;2275 ;    controllers when executing.   Its  main  functions  are:   select
;2276 ;    both  controllers  on the MS780-E/H SBI Interface and execute the
;2277 ;    test that called it, call out an error  if  neither  one  of  the
;2278 ;    controllers can be configured properly, if all the controllers on
;2279 ;    a MS780-E/H were configured and tested, it should select the next
;2280 ;    MS780-E/H on the SBI and repeat the above sequence.
;2281 ;    A test making use of this  subroutine  should  be  configured  as
;2282 ;    follows:
;2283 ;
;2284 ;
;2285 ;       Begin TEST.XX
;2286 ;        :
;2287 ;        :   Call NEWTST
;2288 ;        :   Call FIND.MS780E
;2289 ;        :   IF No MS780-E's on the SBI
;2290 ;        :     THEN
;2291 ;        :         Skip to End of TEST.XX
;2292 ;        :     ELSE
;2293 ;        :
;2294 ;        : RESTART.TEST.XX:
;2295 ;        :
;2296 ;        :   Call START TEST
;2297 ;        :   IF Return1 from START.TEST
;2298 ;        :     THEN
;2299 ;        :         Skip to End of TEST.XX
;2300 ;        :     ELSE.
;2301 ;        :
;2302 ;        ~
;2303 ;
;2304 ;        :
;2305 ;        :   Body of TEST.XX
;2306 ;        :
;2307 ;        ~
;2308 ;
;2309 ;        :   Jump RESTART.TEST.XX
;2310 ;        :
;2311 ;       End TEST.XX
;2312 ;
;2313 ;
;2314 ;         This subroutine makes use of a pointer  in  ID  Register  39
;2315 ;    (Temporary  Register  9)  to  'remember"  at  which point control
;2316 ;    should be passed when the subroutine is called a second, third or
;2317 ;    fourth  time, depending on the number of MS780-E's on the SBI and
;2318 ;    the numbers of controllers on each.  (Note:  Temporary Register 9
;2319 ;    will  be  cleared  by  the  NEWTST subroutine.) The pointer in ID
```

```
;2320 ;    Register 39 can be interpreted as follows:
;2321 ;
;2322 ;     b00   -   Value that ID Reg 39 should hold when the subroutine is
;2323 ;               called the first time.  When this code is encountered
;2324 ;               this subroutine will try to select the lower controller.
;2325 ;               If the lower controller is misconfigured, the pointer in
;2326 ;               ID Reg 39  is changed to b01 (See below) and the subroutine
;2327 ;               is re-entered.
;2328 ;               If, however there is no misconfiguration, the value in
;2329 ;               ID Reg 39 is changed to b10 and a Return2 is made to the
;2330 ;               calling test.
;2331 ;
;2332 ;    b01  -     This value signifies that an attempt at configuring the
;2333 ;               lower controller failed, and the subroutine will attempt
;2334 ;               to select the upper controller.
;2335 ;               If the upper controller is also misconfigured execution
;2336 ;               stops with a call to ERROR1.
;2337 ;               If there is no misconfiguration on this controller, then
;2338 ;               the code in ID Reg 39 is changed to b11 and a Return2 is
;2339 ;               made to the calling test.
;2340 ;
;2341 ;    b10  -     This value signifies that the lower controller was selected
;2342 ;               previously and the test was executed once.  If the
;2343 ;               subroutine is entered with this code in ID Reg 39, ID Reg
;2344 ;               39 is loaded with b11 and an attempt is made to select the
;2345 ;               upper controller.
;2346 ;               If there is a misconfiguration on this controller, this
;2347 ;               subroutine is just re-entered.
;2348 ;               Otherwise, a Return2 will be made to the calling test.
;2349 ;
;2350 ;    b11    -   This code identifies the cases in which the test has
;2351 ;               been executed at least once (i.e., at least one of the
;2352 ;               controllers on the MS780-E unit under test could be
;2353 ;               configured properly).  When this code is detected the
;2354 ;               subroutine clears ID Reg 39 and makes a call to
;2355 ;               ENABLE.NEXT.MS780E.  If all MS780-E units have been
;2356 ;               tested then the subroutine executes a Return1.
;2357 ;               Otherwise the subroutine is re-entered.
;2358 ;
;2359 ;
;2360 ; Calling Constraint: =00
;2361 ; ------------------
;2362 ;
;2363 ;
;2364 ; Inputs:
;2365 ; ------
;2366 ;
;2367 ; ID Register 39 must be cleared by NEWTST
;2368 ;
;2369 ;

            ;2910  .TOC     FIND MS780-E MEMORY
            ;2911 ;**
            ;2912 ; FUNCTIONAL DESCRIPTION:
            ;2913 ;
            ;2914 ;          The diagnostic is designed to handle up to 4 (four)
            ;2915 ;     MS780-E/H's on the 780 SBI. This routine looks at all TR levels
            ;2916 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2917 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2918 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2919 ;     MS780-E/H's found minus one. Also, it is to be noted that the
            ;2920 ;     first MS780-E found will have its starting address set to 0
            ;2921 ;     (zero).
            ;2922 ;     All the other MS780-E/H's found will have their starting address
            ;2923 ;     set to all ones.  Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2924 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2925 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2926 ;     current MS780-E unit under test.
            ;2927 ;     If any of: MS780-A, MS780-C or MA780 is found, its address is
            ;2928 ;     set to maximum.

            ;3109  .PAGE
            ;3110  .TOC "   ENABLE NEXT MS780-E"
            ;3111 ;++
            ;3112 ; FUNCTIONAL DESCRIPTION:
            ;3113 ;
            ;3114 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;3115 ;    They will be tested  separately, according to the TR level at which
            ;3116 ;    they are located,  starting with the one  at the lowest level first.
            ;3117 ;          When  a test has finished  with the first unit, it will have to call
            ;3118 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;3119 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;3120 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;3121 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;3122 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;3123 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;3124 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;3125 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;3126 ;    as  a  pointer  to  ID  registers 3A through 3D.

            ;3204  .TOC "   REGISTER DATA INTEGRITY CHECK"
            ;3205 ;**
            ;3206 ;
            ;3207 ; FUNCTIONAL DESCRIPTION:
            ;3208 ;
            ;3209 ;       This subroutine is used in conjunction with the previously discussed
            ;3210 ;       routine to check the data integrity of some register or memory location.
            ;3211 ;       The data loaded by the the previous routine is a set of patterns
            ;3212 ;       designed to replace the floating one and zero patterns. This specific
            ;3213 ;       subroutine, takes the data from the ID Temporary registers and
            ;3214 ;       writes it to some memory location or register whose address is passed
            ;3215 ;       down from the calling routine in the D register. The data is then
            ;3216 ;       read back masked with some desired bit mask in register RC[3] and
            ;3217 ;       compared to the data that was written. If the received data does
            ;3218 ;       not equal the expected data, an error call is made. Error calls will
            ;3219 ;       be made in the case of unexpected uTraps or interrupts. (Note: The
            ;3220 ;       first longword of the data stored in cache should be a bit
            ;3221 ;       mask, which will be found in ID Temporary register 1 (T1). This
            ;3222 ;       mask may be necessary when the test should check only certain
            ;3223 ;       bits of the register or memory location. If all bits are to be
            ;3224 ;       checked, the mask should obviously be: xFFFFFFFF.) By using
            ;3225 ;       subroutines to perform these functions, the diagnostic tests will
            ;3226 ;       be more readable along with the fact that they can be used by more than
            ;3227 ;       one test in the same overlay (thus saving some WCS storage space).

;3534  .PAGE "TEST 186 CNFG REGISTER ACCESS
;3535 ;**
;3536 ; FUNCTIONAL DESCRIPTION:
;3537 ; ---------------------
;3538 ;
;3539 ; This test verifies whether the registers residing on the SBI interface
;3540 ; can be properly accessed, and it checks the integrity of some of the
;3541 ; bit fields in the Configuration Registers A and B.
;3542 ; The test consists of the following two subtests:
;3543 ;
;3544 ;       SUBTEST 1 - SBI INTERFACE REGISTER ACCESS
;3545 ;
;3546 ; This subtest checks register access for Read/Write operations to all
;3547 ; registers residing on the SBI Interface: CNFG A, CNFG B, Data Latch 1
;3548 ; and Data Latch 2.  It is expected that for normal operation, no Micro-
;3549 ; Traps or Interrupts will occur.  (The test is not concerned with data
;3550 ; integrity of these registers, but just with their accessibility.)
;3551 ;
;3552 ; SUBTEST 2 - CONFIGURATION REGISTER DATA INTEGRITY
;3553 ;
;3554 ; This subtest will test all Read/Write bits in Configuration Registers A
;3555 ; and B for stuck or shorted bits, by using test patterns stored in cache
;3556 ; at address 8 hex for CNFG A and  24 hex for CNFG B which are as
;3557 ; follows:
;3558   ;
;3559   ;x 8
;3560   ;$ 0007,0000,0100,0000,0102,0000,0103,0000
;3561   ;$ 0105,0000,0106,0000,0100,0000,0F7F,0FF8
;3562   ;$ 4000,0000,4555,0550,4AAA,0AA8,4333,0330
;3563   ;$ 4F0F,0F0F,40FF,00FF
;3564 ;
;3565 ;      CNFG Reg A              CNFG Reg B
;3566 ;
;3567 ; Mask:  x07                   x0FF80F7F
;3568 ;
;3569 ;        x100                  x00004000
;3570 ;
;3571 ;        x102                  x05504555
;3572 ;
;3573 ;        x103                  x0AA84AAA
;3574 ;
;3575 ;        x105                  x03304333
;3576 ;
;3577 ;        x106                  x0F0F4F0F
;3578 ;
;3579 ;        x100                  x00FF40FF
;3580 ;
;3581 ; The following bits will be tested:
;3582 ;
;3583 ;
;3584 ;                Bits          Function

;3775  .PAGE "TEST 187 DATA LATCHES 1 AND 2 TEST"
;3776 ;*************************************************************
;3777 ;+++
;3778 ;
;3779 ; Functional Description:
;3780 ; ----------------------
;3781 ;
;3782 ;     This test checks the DATA LATCH 1 and DATA LATCH 2 for stuck
;3783 ; or  shorted  bits  by  using the patterns detailed below.
;3784 ; This  verifies  the
;3785 ; integrity of the INFORMATION FIELD transceivers, the data path to
;3786 ; the latches,  and the D  BUS.  Failure  of  this  test,  if  the
;3787 ; previous test passes, will indicate a fault in one or both of the
;3788 ; latches, although a failure could result from faulty SBI  PARITY,
;3789 ; ID,  MASK,  TAG,  or CNFG/ROM ADDRESS DECODE logic.  Most of this
;3790 ;  logic will be tested more specifically in later tests.
;3791 ;
;3792 ; The test patterns used in  this  test  are  as  follows:
;3793 ;
;3794 ;
;3795 ;  AAAAAAAA
;3796 ;  55555555
;3797 ;  33333333
;3798 ;  0F0F0F0F
;3799 ;  00FF00FF
;3800 ;  0000FFFF
;3801 ;
;3802 ; and they will be stored in cache at address x40
;3803 ;

;3885  .PAGE "TEST 188 STARTING ADDRESS TEST"
;3886 ;************************************************************
;3887 ;***
;3888 ;
;3889 ; Functional Description:
;3890 ; ---------------------
;3891 ;
;3892 ;
;3893 ;      This sequence of tests checks the address limits logic on
;3894 ; the SBI Interface, more specifically that the memory responds
;3895 ; only to addresses in the correct range (i.e., START ADDRESS <=
;3896 ; ACCESSED ADDRESS <= START ADDRS + MEMORY SIZE). Failure of these
;3897 ; tests will most likely indicate a failure of the ADDRESS LIMT
;3898 ; logic on the SBI Interface, although it is also dependent on most
;3899 ; of the SBI Interface logic, the CONTROLLER GOT IT confirmation
;3900 ; and upon the ARRAY SIZE logic on the Controller board. Both
;3901 ; tests run certain patterns through the Starting Address field,
;3902 ; CNFG Reg B <27:19>, and accesses NXM with a Read operation. It is
;3903 ; expected that a Time-Out uTrap will bbe generated.
;3904 ;
;3905 ;
;3906 ;
;3907 ; SUBTEST 1 - STARTING ADDRESS TEST 1 -
;3908 ;
;3909 ;
;3910 ;      This subtest sets the starting address of the memory under
;3911 ; test to different patterns, and references addresses out of the
;3912 ; memory range. It is intended to verify the comparators that
;3913 ; generate the signal "ADR GREAT H' (and, obviously the correlated
;3914 ; logic).
;3915 ; The patterns used will be stored in cache and they are as
;3916 ; follows:
;3917 ;
;3918 ;
;3919 ;   Starting Address <31:16>
;3920 ;         ------------------------
;3921 ;                  0210
;3922 ;                  01C0
;3923 ;                  0360
;3924 ;                  0020
;3925 ;                  0030
;3926 ;                  0040
;3927 ;                  0040
;3928 ;                  0080
;3929 ;                  0080
;3930 ;                  0080
;3931 ;                  0100
;3932 ;                  0100
;3933 ;                  0200
;3934 ;                  0200
;3935 ;                  0200
;3936 ;                  0200
;3937 ;                  0400
;3938 ;                  0400
;3939 ;                  0400
```

```
;3940 ;                    0400
;3941 ;                    0400
;3942 ;                    0800
;3943 ;                    0800
;3944 ;                    0800
;3945 ;                    0800
;3946 ;                    1000
;3947 ;                    1000
;3948 ;                    1000
;3949 ;                    1000
;3950 ;                    1900
;3951 ;
;3952 ; The last address + 1, determined by the memory size, will be added to
;3953 ; the starting address.
;3954 ;
;3955 ; SUBTEST 2 - STARTING ADDRESS TEST 2 -
;3956 ;
;3957 ;      This subtest is similar to the previous one, with the
;3958 ; exception that the starting address to which the memory will be
;3959 ; set is calculated with the following formula:
;3960 ;
;3961 ;   Starting Address = Pattern from Table - Memory Size - 1
;3962 ;
;3963 ; This test is meant to check the comparators that generate the
;3964 ; signal "ADR LESS H".
;3965 ; As before the test patterns will be stored in cache and they are
;3966 ; as follows:
;3967 ;
;3968 ;   Starting Address <31:16>          Referenced Address <31:16>
;3969 ;   ------------------------          --------------------------
;3970 ;                    02F0                              02F0
;3971 ;                    0010                              0020
;3972 ;                    0010                              0080
;3973 ;                    0010                              0040
;3974 ;                    0000                              0010
;3975 ;                    0020                              0040
;3976 ;                    0020                              0080
;3977 ;                    0040                              0080

;4221 ;
;4222 ; Functional Description:
;4223 ; ---------------------
;4224 ;
;4225 ;      This test verifies the  integrity  of  the  Latches  on  the
;4226 ; Controller  board.   Data wrap-around on the controller board was
;4227 ; provided in Diagnostic Mode 1.   In this mode when performing  an
;4228 ; extended  write  to  memory, aside from the data being written on
;4229 ; the array, it will be latched on the controller board as follows:
;4230 ;
;4231 ;  -  Data passing through the LO Q Latch will be latched in
;4232 ;     the Rewrite Latch.
;4233 ;
;4234 ;  -  Data passing through the HI Q and HI X latches will be
;4235 ;           latched in the LO X latch.
;4236 ;
;4237 ; Extended reads will retreive the  data  from  these  latches  for
;4238 ; checking.    When  the read takes place, the path followed by the
;4239 ; data to the SBI is as follows:
;4240 ;
;4241 ;  -  Data latched in the Rewrite Latch will be passed through
;4242 ;     the LO Data OUT Latch
;4243 ;
;4244 ;  -  Data from the LO X Latch will be passed thorugh the
;4245 ;                HI Data OUT Latch.
;4246 ;
;4247 ; This wrap-around feature that was added, improves the ability  of
;4248 ; the diagnostic to detect errors on the Controller Board or on the
;4249 ; data paths between the SBI Interface and the Controller Boards.
;4250 ;
;4251 ; The test patterns used in  this  test  are  as  follows:
;4252 ;
;4253 ;
;4254 ;  AAAAAAAA
;4255 ;  55555555
;4256 ;  33333333
;4257 ;  0F0F0F0F
;4258 ;  00FF00FF
;4259 ;  0000FFFF
;4260 ;
;4261 ; and they will be stored in cache at address x40
;4262 ;
;4263 ; Logic Description:
;4264 ; -----------------
;4265 ;   N/A
;4266 ;
;4267 ; Error Logout:
;4268 ; ------------
;4269 ;
;4270 ; See individual error reports.
;4271 ;
;4272 ; Sync Point Description:

;4570  .PAGE "TEST 18A BASIC MEMORY WRITE READ
;4571 ;*************************************************************
;4572 ;+++
;4573 ;
;4574 ; Functional Description:
;4575 ; ----------------------
;4576 ;
;4577 ;      This test verifies the ability to  perform  EXTENDED  WRITES
;4578 ; and  EXTENDED  READS.  This test is neccesary at this point since
;4579 ; subsequent tests depend upon the ability of reading  and  writing
;4580 ; the arrays.  More extensive array testing will be performed after
;4581 ; checking the SBI Interface and Controller logic.
;4582 ;
;4583 ;      Locations 0 and 4 will be tested for Read/Write  access  and
;4584 ; for  data  integrity  (using the patterns in Appendix B) with the
;4585 ; ECC logic turned off and with it on.
;4586 ;

;1810 ;
;1811 ; MODULE NAME: ESKAR40
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;

;1846  .PAGE
;1847
;1848  .TOC " Micro Trap Handler and LSI-11 Support Routines"
;1849  .TOC "   Micro Trap Handler"
;1850 ;**
;1851 ; FUNCTIONAL DESCRIPTION:
;1852 ;
;1853 ; This routine is responsible for 'catching' micro-traps
;1854 ; and reporting unexpected traps to the Monitor. Register R[0F]
;1855 ; contains the Trap-Expected Mask. If the specified bit is set in
;1856 ; the mask, the bit is cleared and a RETURN0 is made otherwise,
;1857 ; an error call is made.
;1858 ;
;1859 ; INPUT PARAMETERS:
;1860 ;
;1861 ; R[0F] - Expected Trap Mask
;1862 ;  Trap Code Function
;1863 ;  ---------      --------
;1864 ;       0  System Init

            ;1930 ;++
            ;1931 ; FUNCTIONAL DESCRIPTION:
            ;1932 ;
            ;1933 ; This routine Initializes the following registers:
            ;1934 ;  PSL    to 1F
            ;1935 ;  CES    to 0
            ;1936 ;  ACC.CS    to disable accellerator
            ;1937 ;  SIR    to 0
            ;1938 ;  CLK.CS    to stop interval timer
            ;1939 ;  TBER0    to disable the TB
            ;1940 ;  SBI.MAINT to    0
            ;1941 ;  SBI.ERR    to 0
            ;1942 ;  FAULT    to 0
            ;1943 ;  COMP    to 0
            ;1944 ;  RC[0E]    to  0
            ;1945 ;  R[0F]    to 0
            ;1946 ; It also performs an SBI UNJAM and disables the CACHE.
            ;1947 ; A SCOPE call is then made to the Monitor.

;2227  .PAGE
;2228  .TOC "   START TEST"
;2229 ;*************************************************************
;2230 ;**
;2231 ;
;2232 ; Functional Description:
;2233 ; ---------------------
;2234 ;
;2235 ;         This subroutine will be called by all tests that  check  the
;2236 ;    controllers,  or  those  tests  that  have  to switch between the
;2237 ;    controllers when executing.  Its  main  functions  are:  select
;2238 ;    both  controllers  on the MS780-E/H SBI Interface and execute the
;2239 ;    test that called it, call out an error  if  neither  one  of  the
;2240 ;    controllers can be configured properly, if all the controllers on
;2241 ;    a MS780-E/H were configured and tested, it should select the next
;2242 ;    MS780-E/H on the SBI and repeat the above sequence.
;2243 ;    A test making use of this  subroutine  should  be  configured  as
;2244 ;    follows:
;2245 ;
;2246 ;
;2247 ;       Begin TEST.XX
;2248 ;       :
;2249 ;       :   Call NEWTST
;2250 ;       :   Call FIND.MS780E
;2251 ;       :   IF No MS780-E's on the SBI
;2252 ;       :     THEN
;2253 ;       :         Skip to End of TEST.XX
;2254 ;       :     ELSE
;2255 ;       :
;2256 ;       : RESTART.TEST.XX:
;2257 ;       :
;2258 ;       :   Call START TEST
;2259 ;       :   IF Return1 from START.TEST
;2260 ;       :     THEN
;2261 ;       :         Skip to End of TEST.XX
;2262 ;       :     ELSE.
;2263 ;       :
;2264 ;       ~
;2265 ;
;2266 ;       :
;2267 ;       :   Body of TEST.XX
;2268 ;       :
;2269 ;       ~
;2270 ;
;2271 ;       :   Jump RESTART.TEST.XX
;2272 ;       :
;2273 ;       End TEST.XX
;2274 ;
;2275 ;
;2276 ;         This subroutine makes use of a pointer  in  ID  Register  39
;2277 ;    (Temporary  Register  9)  to   remember   at  which point control
;2278 ;    should be passed when the subroutine is called a second, third or
;2279 ;    fourth  time, depending on the number of MS780-E's on the SBI and
;2280 ;    the numbers of controllers on each.  (Note:  Temporary Register 9
;2281 ;    will  be  cleared  by  the  NEWTST subroutine.) The pointer in ID
```

```
;2282 ;    Register 39 can be interpreted as follows:
;2283 ;
;2284 ;     b00   -   Value that ID Reg 39 should hold when the subroutine is
;2285 ;               called the first time.  When this code is encountered
;2286 ;               this subroutine will try to select the lower controller.
;2287 ;               If the lower controller is misconfigured, the pointer in
;2288 ;               ID Reg 39  is changed to b01 (See below) and the subroutine
;2289 ;               is re-entered.
;2290 ;               If, however there is no misconfiguration, the value in
;2291 ;               ID Reg 39 is changed to b10 and a Return2 is made to the
;2292 ;               calling test.
;2293 ;
;2294 ;     b01   -   This value signifies that an attempt at configuring the
;2295 ;               lower controller failed, and the subroutine will attempt
;2296 ;               to select the upper controller.
;2297 ;               If the upper controller is also misconfigured execution
;2298 ;               stops with a call to ERROR1.
;2299 ;               If there is no misconfiguration on this controller, then
;2300 ;               the code in ID Reg 39 is changed to b11 and a Return2 is
;2301 ;               made to the calling test.
;2302 ;
;2303 ;     b10   -   This value signifies that the lower controller was selected
;2304 ;               previously and the test was executed once.  If the
;2305 ;               subroutine is entered with this code in ID Reg 39, ID Reg
;2306 ;               39 is loaded with b11 and an attempt is made to select the
;2307 ;               upper controller.
;2308 ;               If there is a misconfiguration on this controller, this
;2309 ;               subroutine is just re-entered.
;2310 ;               Otherwise, a Return2 will be made to the calling test.
;2311 ;
;2312 ;     b11   -   This code identifies the cases in which the test has
;2313 ;               been executed at least once (i.e., at least one of the
;2314 ;               controllers on the MS780-E unit under test could be
;2315 ;               configured properly).  When this code is detected the
;2316 ;               subroutine clears ID Reg 39 and makes a call to
;2317 ;               ENABLE.NEXT.MS780E.  If all MS780-E units have been
;2318 ;               tested then the subroutine executes a Return1.
;2319 ;               Otherwise the subroutine is re-entered.
;2320 ;
;2321 ;
;2322 ; Calling Constraint: =00
;2323 ; ------------------
;2324 ;

            ;3152  .PAGE
            ;3153  .TOC     ENABLE NEXT MS780-E
            ;3154 ;**
            ;3155 ; FUNCTIONAL DESCRIPTION:
            ;3156 ;
            ;3157 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;3158 ;    They will be tested  separately, according to the TR level at which
            ;3159 ;    they are located,  starting with the one  at the lowest level first.
            ;3160 ;          When  a test has finished  with the first unit, it will have to call
            ;3161 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;3162 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;3163 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;3164 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;3165 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;3166 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;3167 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;3168 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;3169 ;    as  a  pointer  to  ID  registers 3A through 3D.
            ;3170 ;

;3315  .PAGE "TEST 18D SBI FORCED FAULT TESTS"
;3316 ;++
;3317 ; FUNCTIONAL DESCRIPTION:
;3318 ;
;3319 ;          This test checks the fault detection logic on the SBI
;3320 ;     interface board.  Each subtest will verify that the SBI Fault bit
;3321 ;     is cleared once the CPU deasserts the fault.  The fault will be
;3322 ;     checked in the CPU SBI Error/Fault Register as well as in the SBI
;3323 ;     Interface CNFG A Register.  This test will not check for data
;3324 ;     pattern sensitivity.
;3325 ;     The test starts out by generating constants.  For convenience and
;3326 ;     ease of programming these will most likely be stored in cache.
;3327 ;     These constants will be used to mask undesired bits in the SBI
;3328 ;     Error and Fault Registers or the CNFG Register A of the MS780-E
;3329 ;     under test.
;3330 ;
;3331 ;
;3332 ;     SUBTEST 1 - FAULT BITS CLEAR -
;3333 ;
;3334 ;          Check that the SBI Interface Fault and SBI Fault (in ID reg.
;3335 ;     1B,  SBI  Fault-Status)  bits  are initially clear.  If not, then
;3336 ;     attempt to clear them.
;3337 ;
;3338 ;
;3339 ;
;3340 ;     SUBTEST 2 - P0 FAULT -
;3341 ;
;3342 ;          Force P0 Fault using the SBI Maintenance register  (ID  reg.
;3343 ;     1D).   A  check is made to see that a SBI Fault Interrupt occured
;3344 ;     and that bit 31 of CNFG register A is set.
;3345 ;
;3346 ;
;3347 ;     SUBTEST 3 - P1 FAULT -
;3348 ;
;3349 ;          Force P1 Fault using the SBI  Maintenance  Register.   Check
;3350 ;     for  the  occurrence  of a SBI Fault Interrupt and that bit 31 of
;3351 ;     CNFG register A is set.
;3352 ;
;3353 ;
;3354 ;
;3355 ;     SUBTEST 4 - WRITE DATA SEQUENCE FAULT -
;3356 ;
;3357 ;          The SBI Maintenace register is used to force this fault  and
;3358 ;     bit 30 of CNFG register A is checked to see if it is set.
;3359 ;
;3360 ;
;3361 ;
;3362 ;     SUBTEST 5 - NORMAL INTERLOCK SEQUENCE -
;3363 ;
;3364 ;          The subtest verifies the correct operation of the  interlock
;3365 ;     sequence  logic,  by  executing  an Interlock Read followed by an
;3366 ;     Interlock Write, checking that no fault conditions are generated.
;3367 ;
;3368 ;
;3369 ;
```

```
;3370 ;    SUBTEST 6 - INTERLOCK SEQUENCE FAULT -
;3371 ;
;3372 ;         This subtest checks that an Interlock Write  that  does  not
;3373 ;    follow  an  Interlock  Read will cause a fault condition and that
;3374 ;    the logic will detect it.  A time-out will be expected due  to  a
;3375 ;    busy response from the memory.
;3376 ;
;3377 ;
;3378 ;    SUBTEST 7 - INTERLOCK TIMER TEST 1 -
;3379 ;
;3380 ;         Subtests 7 and 8 test the timing of the Interlock  Timer  on
;3381 ;    the  SBI Interface.  In subtest 7 two consecutive Interlock Reads
;3382 ;    are made.  The SBI  Interface  Interlock  Timer  is  expected  to
;3383 ;    time-out before the CPU does.
;3384 ;
;3385 ;
;3386 ;
;3387 ;    SUBTEST 8 - INTERLOCK TIMER TEST 2 -
;3388 ;
;3389 ;         In this subtest a normal Interlock Read  -  Interlock  Write
;3390 ;    sequence  is  executed  with a 100 usec (500 ticks) delay between
;3391 ;    the read and the write, checking that no Interlock Sequence Fault
;3392 ;    occurs.

;5163  .PAGE "TEST 18E CPU AND MEMORY MULT XMIT FLT"
;5164 ;*************************************************************
;5165 ;+++
;5166 ;
;5167 ; Functional Description:
;5168 ; ---------------------
;5169 ;
;5170 ;      This test keeps  a  running  count  in  the  Maintenance  ID
;5171 ; Register  (ID  reg.   1D),  while  forcing a Multiple Transmitter
;5172 ; Fault.  A check is made to see that the CPU and Memory,  each  in
;5173 ; turn,  will  detect the fault when putting Write Data on the SBI.
;5174 ; This tests the ID Comparator logic on the M8219 SBH  module,  and
;5175 ; the Multiple Transmitter bit in the SBI Interface CNFG A register
;5176 ; (bit 27).  Also, a check will be made to see that bit 26 in  CNFG
;5177 ; A register (Memory was TRANSMITTER DURING FAULT) is asserted.
;5178 ;
;5179 ;
;5180 ; SUBTEST 1 - CPU DETECTION OF MULTIPLE XMITTER FAULT -
;5181 ;
;5182 ;      This Subtest keeps a count  pattern  through  the  ID  MAINT
;5183 ; Register    (<27:23>),   while   forcing   multiple   transmitter
;5184 ; faults.  It checks that the SBI Fault Register bit  27  gets  set
;5185 ; when  a multiple transmitter fault occurs for any other ID except
;5186 ; the CPU ID.
;5187 ;
;5188 ;
;5189 ; SUBTEST 2 - MEMORY DETECTION OF MULTIPLE XMITTER FAULT -
;5190 ;
;5191 ;      Subtest 2 is very much similar to  Subtest  1,  except  that
;5192 ; this  time CNF Reg A of the MS780-E under test is checked to make
;5193 ; sure that the Multiple Transmitter bit is set for all ID's except
;5194 ; the CPU's ID.
;5195 ;
;5196 ;

;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;

            ;1843   .TOC  "  MICRO TRAP HANDLER AND LSI-MONITER CALL ROUTINES"
            ;1844 ;*
            ;1845 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1846 ; WITH A NUMBER, AND LOADS THE D REGISTER WITH THE CONTENTS OF R[0F].
            ;1847 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1848 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1849 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1850 ;
            ;1851 ; FOR EXAMPLE: IF A TEST EXPECTED A "TB MISS" MICRO TRAP IT WOULD SET BIT
            ;1852 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1853 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1854 ; R[0F] AND DO A RETURN0.
            ;1855 ;
            ;1856 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1857 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1858 ; TO THE CONSOLE.
            ;1859 ;
            ;1860 ;-

            ;2584  .TOC "    FIND MS780-E MEMORY"
            ;2585 ;**
            ;2586 ; FUNCTIONAL DESCRIPTION:
            ;2587 ;
            ;2588 ;          The diagnostic is designed to handle up to 4 (four)
            ;2589 ;     MS780-E/H's on the 780 SBI. This routine looks at all TR levels
            ;2590 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2591 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2592 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2593 ;     MS780-E/H's found minus one. Also, it is to be noted that the
            ;2594 ;     first MS780-E found will have its starting address set to 0
            ;2595 ;     (zero).
            ;2596 ;     All the other MS780-E/H's found will have their starting address
            ;2597 ;     set to all ones.  Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2598 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2599 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2600 ;     current MS780-E unit under test.
            ;2601 ;     If any of: MS780-A, MS780-C or MA780 is found, its address is
            ;2602 ;     set to maximum.
            ;2603 ;
            ;2604 ; CALLING CONSTRAINT:
            ;2605 ;
            ;2606 ; =00
            ;2607 ;
            ;2608 ; OUTPUTS:
            ;2609 ;
            ;2610 ; rc[0e] - Contains address of Configuration Register
            ;2611 ; r[0]  - Contains TR level
            ;2612 ;
            ;2613 ; SIDE EFFECTS:
            ;2614 ;
            ;2615 ; D register is destroyed.

            ;2921  .TOC     ENABLE NEXT MS780-E
            ;2922 ;**
            ;2923 ; FUNCTIONAL DESCRIPTION:
            ;2924 ;
            ;2925 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;2926 ;    They will be tested  separately, according to the TR level at which
            ;2927 ;    they are located,  starting with the one  at the lowest level first.
            ;2928 ;          When  a test has finished  with the first unit, it will have to call
            ;2929 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;2930 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;2931 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;2932 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;2933 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;2934 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;2935 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;2936 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;2937 ;    as  a  pointer  to  ID  registers 3A through 3D.

;3319  .PAGE  TEST 193 SILO LOCK ON ID COMPARE TEST
;3320 ;*****************************************************************
;3321 ;**
;3322 ;
;3323 ;TEST 195  SILO LOCK ON ID COMPARE TEST
;3324 ;
;3325 ;TEST DESCRIPTION
;3326 ; THIS TEST CHECKS THAT THE SILO LOCKS CORRECTLY WHEN
;3327 ; THE SILO COMPARATOR REGISTER CONDITIONAL LOCK BITS<28:27>
;3328 ; ARE EQUAL TO 01 (LOCK ON ID ONLY).
;3329 ;
;3330 ; SUBTEST 1 PUTS THE CPU'S ID INTO THE MAINTENANCE
;3331 ;   REGISTER ID <27:23> AND CHECKS THAT THE
;3332 ;   SILO LOCKS WHEN A CPU WRITE TO MEMORY IS
;3333 ;   DONE (MAINTENANCE ID=SBI ID) BY CHECKING
;3334 ;   THE SILO COMPARATOR REGISTER.
;3335 ;
;3336 ;
;3337 ; SUBTEST 2 PUTS FIVE DIFFERENT DATA PATTERNS IN
;3338 ;   THE MAINTENANCE REGISTER ID <27:23> AND
;3339 ;   THEN DOES A CPU WRITE TO MEMORY. IT THEN
;3340 ;   CHECKS THAT THE SILO DOES NOT LOCK AND THE
;3341 ;   COUNT FIELD REMAINS UNCHANGED BY
;3342 ;   EXAMINING ID 1C. IF A DATA PATTERN IS
;3343 ;   EQUAL TO THE CPU'S ID, IT IS NOT TESTED HERE.
;3344 ;
;3345 ;   DATA PATTERNS:  00001
;3346 ;     00010
;3347 ;     00100
;3348 ;     01000
;3349 ;     10000
;3350 ;
;3351 ; SUBTEST 3 USES THE SAME DATA PATTERNS AS SUBTEST 2.
;3352 ;   FORCE MULTIPLE TRANSMITTERS IS SET IN THE
;3353 ;   MAINTENANCE REGISTER <28>, FORCING THE
;3354 ;   MAINTENANCE ID TO BE TRANSMITTED WITH THE
;3355 ;   WRITE DATA,THUS CAUSING AN ID MATCH. THE
;3356 ;   COMPARE SIGNAL ASSERTING IS DETECTED ONLY BY
;3357 ;   THE COUNT FIELD INCREMENTING SINCE THE SILO
;3358 ;   COMPARATOR LOCK BIT <31> IS DISABLED BY AN SBI
;3359 ;   FAULT. THE CPU'S ID IS NOT TESTED HERE.

;3526  .PAGE  TEST 194 SILO LOCK ON ID & TAG COMPARE TEST
;3527 ;*************************************************************************
;3528 ;**
;3529 ;
;3530 ;TEST 194  SILO LOCK ON ID & TAG COMPARE TEST
;3531 ;
;3532 ;TEST DESCRIPTION
;3533 ; THIS TEST CHECKS THAT THE SILO LOCKS CORRECTLY WHEN THE
;3534 ; SILO COMPARATOR REGISTER CONDITIONAL LOCK BITS <28:27> ARE
;3535 ; EQUAL TO 10 (LOCK ON ID AND TAG COMPARISON). THE SILO LOCK
;3536 ; ON COMPARISON FUNCTION IS CHECKED BY EXAMINING THE SILO
;3537 ; COMPARATOR REGISTER.
;3538 ;
;3539 ; SUBTEST 1 USES THE CPU'S ID AND A READ DATA TAG.
;3540 ;   A CPU READ OF MEMORY IS EXECUTED. THE
;3541 ;   SILO SHOULD LOCK.
;3542 ;
;3543 ; SUBTEST 2 USES THE CPU'S ID AND A COMMAND ADDRESS
;3544 ;   TAG. A CPU WRITE TO MEMORY IS EXECUTED.
;3545 ;   THE SILO SHOULD LOCK.
;3546 ;
;3547 ; SUBTEST 3 USES THE CPU'S ID AND A WRITE DATA
;3548 ;   TAG. A CPU WRITE TO MEMORY IS EXECUTED.
;3549 ;   THE SILO SHOULD LOCK.
;3550 ;
;3551 ; SUBTEST 4 USES THE CPU'S ID AND AN ISR TAG. AN
;3552 ;   INTERRUPT SUMMARY READ IS INITIATED.
;3553 ;   THE SILO SHOULD LOCK.
;3554 ;
;3555 ; SUBTEST 5 USES AN ID WHICH IS NOT THE CPU'S ID
;3556 ;   AND A COMMAND ADDRESS TAG. A CPU WRITE
;3557 ;   TO MEMORY IS EXECUTED. THE SILO SHOULD
;3558 ;   NOT LOCK.
;3559 ;
;3560 ; SUBTEST 6 USES THE CPU'S ID AND A READ DATA TAG.
;3561 ;   A CPU WRITE TO MEMORY IS EXECUTED.
;3562 ;   THE SILO SHOULD NOT LOCK.
;3563 ;
;3564 ;LOGIC DESCRIPTION

            ;3809 ;
            ;3810 ;TEST 195  SILO LOCK ON ID,TAG & FUNCTION COMPARE TEST
            ;3811 ;  FUNCTION COMPARISON TEST
            ;3812 ;
            ;3813 ;TEST DESCRIPTION
            ;3814 ; THIS TEST CHECKS THAT THE SILO LOCKS CORRECTLY WHEN
            ;3815 ; THE SILO COMPARATOR REGISTER CONDITIONAL LOCK BITS
            ;3816 ; ARE EQUAL TO 1,1 (LOCK ON ID, TAG AND FUNCTION
            ;3817 ; COMPARISON). SUBTESTS 1-5 USE THE CPU'S ID AND A COMMAND
            ;3818 ; ADDRESS TAG (3) FOR COMPARISON. SUBTEST 6 USES THE CPU'S
            ;3819 ; ID AND AN INVALID TAG OF 7.
            ;3820 ;
            ;3821 ; SUBTEST 1 USES A READ MASKED FUNCTION CODE.
            ;3822 ;   A CPU READ OF I/O SPACE IS EXECUTED.
            ;3823 ;   THE SILO SHOULD LOCK.
            ;3824 ; SUBTEST 2 USES A WRITE MASKED FUNCTION CODE.
            ;3825 ;   A CPU WRITE TO MEMORY IS EXECUTED.
            ;3826 ;   THE SILO SHOULD LOCK.
            ;3827 ; SUBTEST 3 USES AN INTERLOCKED READ MASKED
            ;3828 ;   FUNCTION CODE. A CPU INTERLOCKED READ
            ;3829 ;   OF MEMORY IS EXECUTED. THE SILO SHOULD
            ;3830 ;   LOCK.
            ;3831 ; SUBTEST 4 USES AN EXTENDED READ FUNCTION CODE.
            ;3832 ;   A CPU READ OF MEMORY IS EXECUTED.
            ;3833 ;   THE SILO SHOULD LOCK.
            ;3834 ; SUBTEST 5 USES AN INVALID FUNCTION CODE OF ZERO.
            ;3835 ;   A CPU WRITE TO MEMORY IS EXECUTED.
            ;3836 ;   THE SILO SHOULD NOT LOCK.
            ;3837 ; SUBTEST 6 USES A WRITE MASKED FUNCTION CODE.
            ;3838 ;   A CPU WRITE TO MEMORY IS EXECUTED.
            ;3839 ;   THE SILO SHOULD NOT LOCK DUE TO THE INVALID
            ;3840 ;   TAG WHICH IS USED.
            ;3841 ;

;1808 ;*****************************************************************************
;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR42
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:
;1834 ;
;1835 ; 2.1 Joe Zagarella 11-jul-1985
;1836 ;  With the ms780-e/h configured with only the upper
;1837 ;  controller, test 19a would fail because it only
;1838 ;  checked for the lower controller. Added code at
;1839 ;  label 'try.upper' to check for the upper controller.

            ;1846
            ;1847  .TOC   MICRO TRAP HANDLER AND LSI-MONITER CALL ROUTINES
            ;1848 ;*
            ;1849 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1850 ; WITH A NUMBER, AND LOADS THE D REGISTER WITH THE CONTENTS OF R[0F].
            ;1851 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1852 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1853 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1854 ;
            ;1855 ; FOR EXAMPLE: IF A TEST EXPECTED A 'TB MISS" MICRO TRAP IT WOULD SET BIT
            ;1856 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1857 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1858 ; R[0F] AND DO A RETURN0.
            ;1859 ;
            ;1860 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1861 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1862 ; TO THE CONSOLE.
            ;1863 ;

            ;2300  .TOC "   FIND MS780-E MEMORY"
            ;2301 ;**
            ;2302 ; FUNCTIONAL DESCRIPTION:
            ;2303 ;
            ;2304 ;          The diagnostic is designed to handle up to 4 (four)
            ;2305 ;     MS780-E/H's on the 780 SBI. This routine looks at all TR levels
            ;2306 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2307 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2308 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2309 ;     MS780-E/H's found minus one. Also, it is to be noted that the
            ;2310 ;     first MS780-E found will have its starting address set to 0
            ;2311 ;     (zero).
            ;2312 ;     All the other MS780-E/H's found will have their starting address
            ;2313 ;     set to all ones. Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2314 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2315 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2316 ;     current MS780-E unit under test.
            ;2317 ;     If any of: MS780-A, MS780-C or MA780 is found, its address is
            ;2318 ;     set to maximum.
            ;2319 ;

            ;2502  .PAGE
            ;2503  .TOC     ENABLE NEXT MS780-E
            ;2504 ;++
            ;2505 ; FUNCTIONAL DESCRIPTION:
            ;2506 ;
            ;2507 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;2508 ;     They will be tested  separately, according to the TR level at which
            ;2509 ;     they are located,  starting with the one  at the lowest level first.
            ;2510 ;          When  a test has finished  with the first unit, it will have to call
            ;2511 ;     this specific  routine  to see  if any other MS780-E unit is present
            ;2512 ;     on the SBI. If more units are  present, the first one  will be  dis-
            ;2513 ;     abled  by  setting  its  starting  address to maximum, the next unit
            ;2514 ;     will be  enabled  by  setting its starting address to 0 and the test
            ;2515 ;     will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;2516 ;     for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;2517 ;     ID registers 3A through 3D and  a count of the Total number of units
            ;2518 ;     found - 1 in register 3E. In this subroutine the SC register is used
            ;2519 ;     as  a  pointer  to  ID  registers 3A through 3D.

;3197 ; SBI COMMANDS AND STALL USING SILO
;3198 ;
;3199 ;
;3200 ; TEST DESCRIPTION
;3201 ;
;3202 ;       THIS TEST CHECK THE COMMANDS ISSUED BY THE
;3203 ; CPU SBI INTERFACE.  THE STALL TIMING IS CHECKED
;3204 ; ALSO.  THE ADDRESS BIT #29 IS CHANGE TO SEE THAT
;3205 ; THE FUNCTIONS ARE PROPER IF A I/O REFERENCE IS MADE.
;3206 ; THE FOLLOWING TABLE IS USED TO DESCRIBE THE DIFFERENT CPU/
;3207 ; SBI OPERATIONS:
;3208 ;
;3209 ; NOTE: EXT R EXTENDED READ OPERATION
;3210 ;  EXT W EXTENDED WRITE OPERATION
;3211 ;  IR INTERLOCK READ
;3212 ;  IW INTERLOCK WRITE
;3213 ;  MASK R MASKED READ OPERATION
;3214 ;  MASK W MASKED WRITE OPERATION
;3215 ;
;3216 ;  IT SHOULD BE NOTED THAT READ.V.WCHK OPERATIONS ARE
;3217 ;  TRANSFORMED INTO INTERLOCK OPERATION IF I/O SPACE IS
;3218 ;  ADDRESSED.  THE IMPLICT INTERLOCK FLIP/FLOP (IMPLICT)
;3219 ;  IS USED TO TRANSFORM THE NEXT WRITE TO AN INTERLOCK WRITE
;3220 ;  OPERATION.
;3221 ;
;3222 ; MCT/FUNCTION  NON I/O  I/O  COMMENT
;3223 ;    (ADDR #29=0) (ADDR #29=1)
;3224 ;
;3225 ; READ.P   EXT R  MASK R
;3226 ; READ.V.RCHK  EXT R  MASK R
;3227 ; READ.V.NOCHK  EXT R  MASK R
;3228 ; READ.V.WCHK  EXT R  IR SET IMPLICT IF GOOD
;3229 ;        DATA RETURNED
;3230 ;
;3231 ;  WRITE.P   MASK W  IW(IF IMPLICT),MASK W
;3232 ;  WRITE.V.NOCHK  MASK W  IW(IF IMPLICT),MASK W
;3233 ;  WRITE.V.WCHK  MASK W  IW(IF IMPLICT),MASK W
;3234 ;

;1807  .PAGE 'MODULE REVISION HISTORY
;1808 ;*****************************************************************************
;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR43
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:
;1834 ;
;1835 ; 2.1 Joe Zagarella  11-jul-1985
;1836 ;
;1837 ;  With only the upper controller configured on
;1838 ;  an ms780-e/h, test 19d would fail because it
;1839 ;  only checked for the lower controller. Added
;1840 ;  code at label 'try.upper' to check for the upper
;1841 ;  controller.
;1842 ;
;1843 ;
;1844 ;
;1845 ;*****************************************************************************

```

```
            ;1847  .PAGE
            ;1848  .TOC " MICRO TRAP HANDLER AND LSI-MONITER CALL ROUTINES"
            ;1849 ;*
            ;1850 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1851 ; WITH A NUMBER, AND LOADS THE D REGISTER WITH THE CONTENTS OF R[0F].
            ;1852 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1853 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1854 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1855 ;
            ;1856 ; FOR EXAMPLE: IF A TEST EXPECTED A "TB MISS" MICRO TRAP IT WOULD SET BIT
            ;1857 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1858 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1859 ; R[0F] AND DO A RETURN0.
            ;1860 ;
            ;1861 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1862 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1863 ; TO THE CONSOLE.
            ;1864 ;
            ;1865 ;-

            ;1917 ;**
            ;1918 ; FUNCTIONAL DESCRIPTION:
            ;1919 ;
            ;1920 ; This routine Initializes the following registers:
            ;1921 ;  PSL    to 1F
            ;1922 ;  CES    to 0
            ;1923 ;  ACC.CS   to disable accellerator
            ;1924 ;  SIR    to 0
            ;1925 ;  CLK.CS   to stop interval timer
            ;1926 ;  TBER0   to disable the TB
            ;1927 ;  SBI.MAINT to    0
            ;1928 ;  SBI.ERR   to 0
            ;1929 ;  FAULT   to 0
            ;1930 ;  COMP    to 0
            ;1931 ;  RC[0E]    to  0
            ;1932 ;  R[0F]    to 0
            ;1933 ; It also performs an SBI UNJAM and disables the CACHE.
            ;1934 ; A SCOPE call is then made to the Monitor.
            ;1935 ;
            ;1936 ; CALLING CONSTRAINT:

            ;2301  .TOC "   FIND MS780-E MEMORY"
            ;2302 ;++
            ;2303 ; FUNCTIONAL DESCRIPTION:
            ;2304 ;
            ;2305 ;          The diagnostic is designed to handle up to 4 (four)
            ;2306 ;     MS780-E/H's on the 780 SBI.  This routine looks at all TR levels
            ;2307 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2308 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2309 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2310 ;     MS780-E/H's found minus one.  Also, it is to be noted that the
            ;2311 ;     first MS780-E found will have its starting address set to 0
            ;2312 ;     (zero).
            ;2313 ;     All the other MS780-E/H's found will have their starting address
            ;2314 ;     set to all ones.  Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2315 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2316 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2317 ;     current MS780-E unit under test.
            ;2318 ;     If any of:  MS780-A, MS780-C or MA780 is found, its address is
            ;2319 ;     set to maximum.

            ;2504  .TOC "   ENABLE NEXT MS780-E"
            ;2505 ;++
            ;2506 ; FUNCTIONAL DESCRIPTION:
            ;2507 ;
            ;2508 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;2509 ;    They will be tested  separately, according to the TR level at which
            ;2510 ;    they are located,  starting with the one  at the lowest level first.
            ;2511 ;          When  a test has finished  with the first unit, it will have to call
            ;2512 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;2513 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;2514 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;2515 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;2516 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;2517 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;2518 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;2519 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;2520 ;    as  a  pointer  to  ID  registers 3A through 3D.

;1810 ;
;1811 ; MODULE NAME: ESKAR44
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:

            ;1841   .PAGE
            ;1842
            ;1843   .TOC " MICRO TRAP HANDLER AND LSI-MONITER CALL ROUTINES"
            ;1844 ;*
            ;1845 ; FOLLOWING ARE THE MICRO TRAP VECTOR ASSIGNMENTS. EACH VECTOR LOADS THE SC
            ;1846 ; WITH A NUMBER, AND LOADS THE D REGISTER WITH THE CONTENTS OF R[0F].
            ;1847 ; R[0F] IS SETUP BY THE PROGRAM TO INDICATE WHETHER A MICRO TRAP IS EXPECTED
            ;1848 ; THIS IS DONE BY SETTING THE BIT IN R[0F] THAT CORRESPONDS TO THE NUMBER
            ;1849 ; THAT IS LOADED INTO THE SC BY THAT PARTICULAR MICRO TRAP.
            ;1850 ;
            ;1851 ; FOR EXAMPLE: IF A TEST EXPECTED A 'TB MISS' MICRO TRAP IT WOULD SET BIT
            ;1852 ; 6 IN SCRATCH PAD R[0F]. WHEN THE TRAP OCCURRED, THE TRAP CATCHER
            ;1853 ; ROUTINE WOULD SENSE THAT THE TRAP WAS EXPECTED AND CLEAR BIT 6 IN
            ;1854 ; R[0F] AND DO A RETURN0.
            ;1855 ;
            ;1856 ; IF THE BIT FOR THE PARTICULAR TRAP IS NOT SET IN R[0F], THE TRAP ROUTINE
            ;1857 ; READS THE ERROR REGISTERS, SAVES THEM FOR TYPEOUT, AND MAKES AN ERROR CALL
            ;1858 ; TO THE CONSOLE.
            ;1859 ;
            ;1860 ;-

            ;2132  .TOC "    FIND MS780-E MEMORY"
            ;2133 ;**
            ;2134 ; FUNCTIONAL DESCRIPTION:
            ;2135 ;
            ;2136 ;          The diagnostic is designed to handle up to 4 (four)
            ;2137 ;     MS780-E/H's on the 780 SBI. This routine looks at all TR levels
            ;2138 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2139 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2140 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2141 ;     MS780-E/H's found minus one. Also, it is to be noted that the
            ;2142 ;     first MS780-E found will have its starting address set to 0
            ;2143 ;     (zero).
            ;2144 ;     All the other MS780-E/H's found will have their starting address
            ;2145 ;     set to all ones.  Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2146 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2147 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2148 ;     current MS780-E unit under test.
            ;2149 ;     If any of: MS780-A, MS780-C or MA780 is found, its address is
            ;2150 ;     set to maximum.
            ;2151 ;

            ;2334  .PAGE
            ;2335  .TOC     ENABLE NEXT MS780-E
            ;2336 ;**
            ;2337 ; FUNCTIONAL DESCRIPTION:
            ;2338 ;
            ;2339 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;2340 ;    They will be tested  separately, according to the TR level at which
            ;2341 ;    they are located,  starting with the one  at the lowest level first.
            ;2342 ;          When  a test has finished  with the first unit, it will have to call
            ;2343 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;2344 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;2345 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;2346 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;2347 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;2348 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;2349 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;2350 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;2351 ;    as  a  pointer  to  ID  registers 3A through 3D.

;2979 .PAGE "TEST 1A1 MISCELLANEOUS SILO AND SBI (CPU) INTERFACE TESTS'
;2980 ;================================================================
;2981 ;**
;2982 ; TEST   MISCELLANEOUS SILO AND SBI (CPU) INTERFACE TESTS
;2983 ;
;2984 ;
;2985 ; TEST DESCRIPTION
;2986 ;
;2987 ; SUBTEST 1 GENERATE CONSTANTS, FIND CPU ID
;2988 ;
;2989 ;
;2990 ; SUBTEST 2 TEST SETTING AND CLEARING OF THE IMPLICT
;2991 ;  INTERLOCK FLOP ON THE SBI INTERFACE. THE TEST CHECKS
;2992 ;  THAT THE WRITE OPERATION FOLLOWING THE
;2993 ;  READ.V.WCHK TO I/O SPACE IS TRANSFORMED INTO AN
;2994 ;  WRITE COMMAND. ALSO CHECKED IS THAT THE SECOND WRITE
;2995 ;  TO FOLLOW THE READ.V.WCHK (TO I/O SPACE) IS NOT
;2996 ;  TRANSFORMED TO AN INTERLOCK WRITE OPERATION( THUS
;2997 ;  SEEING THE IMPLICT INTERLOCK FLOP CLEARED).
;2998 ;
;2999 ; SUBTEST 3 THIS TEST CHECK THAT IF THE READ.V.WCHK DOES NOT RETURN
;3000 ;  GOOD DATA, THE IMPLICT INTERLOCK FLOP DOES
;3001 ;  NOT GET SET. A ADDRESS CAUSING A TIMEOUT IS USED WITH
;3002 ;  THE READ.V.WCHK OPERATION TO PREVENT GOOD DATA FROM
;3003 ;  BEING RETURNED.
;3004 ;
;3005 ; SUBTEST 4 IN THIS TEST THE SILO WILL BE USED TO VERIFY THE CPU-
;3006 ;  RETRIES THE OPERATION WHEN A NO-RESPONSE IS RETURNED
;3007 ;  BY THE  NEXUS( MEMORY). A READ OPERATION TO AN NON-
;3008 ;  EXISTANT I/O ADDRESS WILL BE TRIED AND AFTER THE SILO
;3009 ;  LOCKS, 3 RETRY SEQUENCES WILL BE READ AND
;3010 ;  CHECKED FOR IN THE SILO.
;3011 ;
;3012 ; SUBTEST 5 UNEXPECTED READ FAULT WILL BE CHECKED. THE CPU I.D.
;3013 ;  WILL BE USED TO SEE IF THE CPU CAN DETECT UNEXPECTED
;3014 ;  READ DATA.
;3015 ;
;3016 ; SUBTEST 6 ERROR COMFRIMATION ON BYTE WRITE TO I/O SPACE
;3017 ;
;3018 ; SUBTEST 7 ERROR COMFRIMATION ON EXTENTED WRITES TO I/O SPACE

;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR45
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:

;1843  .TOC " Micro Trap Handler and LSI-11 Support Routines"
;1844  .TOC "   Micro Trap Handler"
;1845 ;++
;1846 ; FUNCTIONAL DESCRIPTION:
;1847 ;
;1848 ; This routine is responsible for 'catching' micro-traps
;1849 ; and reporting unexpected traps to the Monitor. Register R[0F]
;1850 ; contains the Trap-Expected Mask. If the specified bit is set in
;1851 ; the mask, the bit is cleared and a RETURN0 is made otherwise,
;1852 ; an error call is made.
;1853 ;
;1854 ; INPUT PARAMETERS:
;1855 ;
;1856 ; R[0F] - Expected Trap Mask
;1857 ;  Trap Code Function
;1858 ;  --------      --------
;1859 ;       0  System Init
;1860 ;       1  Data Unaligned
;1861 ;       2  Cross Page
;1862 ;       3  TB Modify
;1863 ;       4  TB Protection
;1864 ;       6  TB Miss
;1865 ;       7  TB Parity
;1866 ;       8  Cache Parity
;1867 ;       9  Reserved Floating Operand
;1868 ;       C  Read Data Substitute
;1869 ;       D  Time out
;1870 ;       F  Control Store Parity Error
;1871 ;      10  Odd Address
;1872 ;
;1873 ; OUTPUT PARAMETERS:
;1874 ;
;1875 ; R[0F] - Mask bit is cleared.
;1876 ;

;2211   .PAGE
;2212   .TOC "   START TEST"
;2213 ;*************************************************************
;2214 ;++
;2215 ;
;2216 ; Functional Description:
;2217 ; ---------------------
;2218 ;
;2219 ;         This subroutine will be called by all tests that  check  the
;2220 ;    controllers,  or  those  tests  that  have  to switch between the
;2221 ;    controllers when executing.   Its  main  functions  are:   select
;2222 ;    both  controllers  on the MS780-E/H SBI Interface and execute the
;2223 ;    test that called it, call out an error  if  neither  one  of  the
;2224 ;    controllers can be configured properly, if all the controllers on
;2225 ;    a MS780-E/H were configured and tested, it should select the next
;2226 ;    MS780-E/H on the SBI and repeat the above sequence.
;2227 ;    A test making use of this  subroutine  should  be  configured  as
;2228 ;    follows:
;2229 ;
;2230 ;
;2231 ;       Begin TEST.XX
;2232 ;       :
;2233 ;       :   Call NEWTST
;2234 ;       :   Call FIND.MS780E
;2235 ;       :   IF No MS780-E's on the SBI
;2236 ;       :     THEN
;2237 ;       :         Skip to End of TEST.XX
;2238 ;       :     ELSE
;2239 ;       :
;2240 ;       : RESTART.TEST.XX:
;2241 ;       :
;2242 ;       :   Call START TEST
;2243 ;       :   IF Return1 from START.TEST
;2244 ;       :     THEN
;2245 ;       :         Skip to End of TEST.XX
;2246 ;       :     ELSE.
;2247 ;       :
;2248 ;       ~
;2249 ;       ~
;2250 ;       :
;2251 ;       :   Body of TEST.XX
;2252 ;       :
;2253 ;       ~
;2254 ;       ~
;2255 ;       :   Jump RESTART.TEST.XX
;2256 ;       :
;2257 ;       End TEST.XX
;2258 ;
;2259 ;
;2260 ;         This subroutine makes use of a pointer  in  ID  Register  39
;2261 ;    (Temporary  Register  9)  to  "remember"  at  which point control
;2262 ;    should be passed when the subroutine is called a second, third or
;2263 ;    fourth  time, depending on the number of MS780-E's on the SBI and
;2264 ;    the numbers of controllers on each.  (Note:  Temporary Register 9
;2265 ;    will  be  cleared  by  the  NEWTST subroutine.) The pointer in ID
```

```
;2266 ;    Register 39 can be interpreted as follows:
;2267 ;
;2268 ;     b00   -   Value that ID Reg 39 should hold when the subroutine is
;2269 ;               called the first time.  When this code is encountered
;2270 ;               this subroutine will try to select the lower controller.
;2271 ;               If the lower controller is misconfigured, the pointer in
;2272 ;               ID Reg 39  is changed to b01 (See below) and the subroutine
;2273 ;               is re-entered.
;2274 ;               If, however there is no misconfiguration, the value in
;2275 ;               ID Reg 39 is changed to b10 and a Return2 is made to the
;2276 ;               calling test.
;2277 ;
;2278 ;    b01  -     This value signifies that an attempt at configuring the
;2279 ;               lower controller failed, and the subroutine will attempt
;2280 ;               to select the upper controller.
;2281 ;               If the upper controller is also misconfigured execution
;2282 ;               stops with a call to ERROR1.
;2283 ;               If there is no misconfiguration on this controller, then
;2284 ;               the code in ID Reg 39 is changed to b11 and a Return2 is
;2285 ;               made to the calling test.
;2286 ;
;2287 ;    b10  -     This value signifies that the lower controller was selected
;2288 ;               previously and the test was executed once.  If the
;2289 ;               subroutine is entered with this code in ID Reg 39, ID Reg
;2290 ;               39 is loaded with b11 and an attempt is made to select the
;2291 ;               upper controller.
;2292 ;               If there is a misconfiguration on this controller, this
;2293 ;               subroutine is just re-entered.
;2294 ;               Otherwise, a Return2 will be made to the calling test.
;2295 ;
;2296 ;    b11   -    This code identifies the cases in which the test has
;2297 ;               been executed at least once (i.e., at least one of the
;2298 ;               controllers on the MS780-E unit under test could be
;2299 ;               configured properly).  When this code is detected the
;2300 ;               subroutine clears ID Reg 39 and makes a call to
;2301 ;               ENABLE.NEXT.MS780E.  If all MS780-E units have been
;2302 ;               tested then the subroutine executes a Return1.
;2303 ;               Otherwise the subroutine is re-entered.
;2304 ;
;2305 ;
;2306 ; Calling Constraint: =00
;2307 ; ------------------
;2308 ;
;2309 ;
;2310 ; Inputs:
;2311 ; ------
;2312 ;
;2313 ; ID Register 39 must be cleared by NEWTST
;2314 ;
;2315 ;
;2316 ; Outputs:
;2317 ; -------
;2318 ;
;2319 ; RC[0E] will have the I/O Base address of MS780-E/H to be tested
;2320 ; RC[0D] will be set up with the CNFG Register C/D of Controller
```

```

            ;2825  .PAGE
            ;2826  .TOC "   FIND MS780-E MEMORY"
            ;2827 ;**
            ;2828 ; FUNCTIONAL DESCRIPTION:
            ;2829 ;
            ;2830 ;          The diagnostic is designed to handle up to 4 (four)
            ;2831 ;     MS780-E/H's on the 780 SBI.  This routine looks at all TR levels
            ;2832 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2833 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2834 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2835 ;     MS780-E/H's found minus one.  Also, it is to be noted that the
            ;2836 ;     first MS780-E found will have its starting address set to 0
            ;2837 ;     (zero).
            ;2838 ;     All the other MS780-E/H's found will have their starting address
            ;2839 ;     set to all ones.  Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2840 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2841 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2842 ;     current MS780-E unit under test.
            ;2843 ;     If any of:  MS780-A, MS780-C or MA780 is found, its address is
            ;2844 ;     set to maximum.
            ;2845 ;
            ;2846 ; CALLING CONSTRAINT:

            ;3025  .PAGE
            ;3026  .TOC "   ENABLE NEXT MS780-E"
            ;3027 ;++
            ;3028 ; FUNCTIONAL DESCRIPTION:
            ;3029 ;
            ;3030 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;3031 ;    They will be tested  separately, according to the TR level at which
            ;3032 ;    they are located,  starting with the one  at the lowest level first.
            ;3033 ;          When  a test has finished  with the first unit, it will have to call
            ;3034 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;3035 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;3036 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;3037 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;3038 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;3039 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;3040 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;3041 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;3042 ;    as  a  pointer  to  ID  registers 3A through 3D.
            ;3043 ;

;3345  .PAGE "TEST 1A6 D BUS PARITY CHECKING/GENERATION"
;3346 ;*************************************************************
;3347 ;+++
;3348 ;
;3349 ; Functional Description:
;3350 ; ----------------------
;3351 ;         This test verifies whether the controller can detect a parity error.
;3352 ;  This is done by initializing location 0 of the array  with some  test data.
;3353 ; When the test data is read back out, the Force D Bus Parity Error bit (CNFG
;3354 ; Reg B) is set thus forcing a Parity Error. Bits 20 and 19 (or 18 depending
;3355 ; on which controller is being addresed) in CNFG A register are checked to see
;3356 ; if they are set.
;3357 ;
;3358 ; SUBTEST 1 - PARITY GENERATION LOGIC
;3359 ;
;3360 ; Data patterns are written to the array and read back without forcing an
;3361 ; error.  If a parity error is reported then there is a fault in the parity
;3362 ; generation   logic or the error reporting logic.
;3363 ;
;3364 ; SUBTEST 2 - PARITY CHECKING LOGIC
;3365 ;
;3366 ; Data patterns are written to memory and is read out with the Force D Bus
;3367 ; Parity Error bit set.##
;3368 ; A check is made to see if bit 20 and 19 (or 18 as the case may be)
;3369 ; in CNFG A register operate correctly.
;3370 ;
;3371 ; The test patterns used in this test will be stored in cache and they are:

;4143  .PAGE "TEST 1A8 BYTE WRITE TO MEMORY TEST"
;4144 ;************************************************************
;4145 ;***
;4146 ;
;4147 ; Functional Description:
;4148 ; ----------------------
;4149 ;
;4150 ; This test writes a byte at a time to each of the four bytes within a
;4151 ; longword.  It starts out by writing zeroes to the memory, and consists
;4152 ; of rotating FF (hex) in a field of zeroes through each of the four
;4153 ; bytes.  Failure of this test will indicate malfunctions of the MASK
;4154 ; lines:  MASK Latch on the SBI Interface, MASK Latch and/or MASK Queue
;4155 ; on the Controller or the data paths between these.
;4156 ;
;4157 ;   [Subtest 1:]
;4158 ;
;4159 ; This subtest floats a byte of xFF or x00, as the case may be, across a
;4160 ; field of ones or zeroes.  The subtest initializes memory location zero
;4161 ; to some pattern and then writes a different pattern to the same
;4162 ; location.  These patters are as detailed below:
;4163 ;
;4164 ; Initial memory pattern  Byte Pattern for test
;4165 ; ----------------------  --------------------
;4166 ;
;4167 ;       xFFFFFF00         x000000FF
;4168 ;       xFFFF00FF         x0000FF00
;4169 ;       xFF00FFFF         x00FF0000
;4170 ;       x00FFFFFF         xFF000000
;4171 ;       x000000FF         xFFFFFF00
;4172 ;       x0000FF00         xFFFF00FF
;4173 ;       x00FF0000         xFF00FFFF
;4174 ;       xFF000000         x00FFFFFF
;4175 ;
;4176 ;   [Subtest 2:]
;4177 ;
;4178 ; This subtest initializes locations 0 and 4 to xFFFFFFFF and floats a
;4179 ; byte of zeroes across a quad-word field of ones.  It is expected that
;4180 ; only the addressed byte will be over-written.
;4181 ;

;4694  .PAGE "TEST 1A9 UNALIGNED READ/WRITE FROM/TO  MEMORY"
;4695 ;*****************************************************************
;4696 ;+++
;4697 ;
;4698 ; Functional Description:
;4699 ; ---------------------
;4700 ;
;4701 ; TEST 22 - UNALIGNED READS AND WRITES TO MEMORY -
;4702 ;
;4703 ;      This test checks the micro-trap resulting from an  unaligned
;4704 ; write  and  unaligned  read to/from memory.  The unaligned writes
;4705 ; are checked with longword reads on longword boundaries.  For  the
;4706 ; unaligned  read,  the test data is written using longword-aligned
;4707 ; writes.
;4708 ;
;4709 ;
;4710 ;
;4711 ;  SUBTEST 1 - UNALIGNED WRITE -
;4712 ;
;4713 ;      A test pattern will be stored in Cache.   This  pattern  is:
;4714 ; AAAAAAAA.
;4715 ; The test uses a byte counter to force the Unaligned  Data  Traps.
;4716 ; After  one memory reference the test pattern will be shifted left
;4717 ; 8 bits and the byte counter will be incremented  by  one.   Thus,
;4718 ; the data read back from memory (locations 0 and 4) without errors
;4719 ; should be:
;4720 ;
;4721 ;
;4722 ; Sequence Number of     Byte          Received Data from Location:
;4723 ; Unaligned Writes       Counter          0            4
;4724 ;
;4725 ;    First                 0          00000000     AAAAAAAA
;4726 ;
;4727 ;    Second                1          000000AA     AAAAAA00
;4728 ;
;4729 ;    Third                 2          0000AAAA     AAAA0000
;4730 ;
;4731 ;    Fourth                3          00AAAAAA     AA000000
;4732 ;
;4733 ;    Fifth                 4          AAAAAAAA     00000000
;4734 ;
;4735 ;
;4736 ;
;4737 ;  SUBTEST 2 - UNALIGNED READS -
;4738 ;
;4739 ;      Memory locations 0 and 4 will be initialize with a  specific
;4740 ; data pattern (same as in subtest 1).  A byte counter will be used
;4741 ; to perform unaligned reads  (READ.V.WCHK)  from  memory.   Checks
;4742 ; will be made for Unaligned uTraps and for data integrity.
;4743 ;
;4744 ;
;4745  ;
;4746  ; CACHE DATA
;4747  ;% 8
;4748  ;$ AAAA,AAAA

;1810 ;
;1811 ; MODULE NAME: ESKAR46
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;

;1841  .PAGE
;1842
;1843  .TOC " Micro Trap Handler and LSI-11 Support Routines'
;1844  .TOC "   Micro Trap Handler"
;1845 ;++
;1846 ; FUNCTIONAL DESCRIPTION:
;1847 ;
;1848 ; This routine is responsible for 'catching' micro-traps
;1849 ; and reporting unexpected traps to the Monitor. Register R[0F]
;1850 ; contains the Trap-Expected Mask. If the specified bit is set in
;1851 ; the mask, the bit is cleared and a RETURN0 is made otherwise,
;1852 ; an error call is made.
;1853 ;
;1854 ; INPUT PARAMETERS:
;1855 ;
;1856 ; R[0F] - Expected Trap Mask
;1857 ;  Trap Code Function
;1858 ;  ---------     --------
;1859 ;       0  System Init
;1860 ;       1  Data Unaligned
;1861 ;       2  Cross Page
;1862 ;       3  TB Modify
;1863 ;       4  TB Protection
;1864 ;       6  TB Miss
;1865 ;       7  TB Parity
;1866 ;       8  Cache Parity
;1867 ;       9  Reserved Floating Operand
;1868 ;       C  Read Data Substitute
;1869 ;       D  Time out
;1870 ;       F  Control Store Parity Error
;1871 ;      10  Odd Address
;1872 ;
;1873 ; OUTPUT PARAMETERS:
;1874 ;
;1875 ; R[0F] - Mask bit is cleared.
;1876 ;
;1877 ; DATA: Micro PC of Micro Trap

            ;1926 ;++
            ;1927 ; FUNCTIONAL DESCRIPTION:
            ;1928 ;
            ;1929 ; This routine Initializes the following registers:
            ;1930 ;  PSL    to 1F
            ;1931 ;  CES    to 0
            ;1932 ;  ACC.CS    to disable accellerator
            ;1933 ;  SIR    to 0
            ;1934 ;  CLK.CS    to stop interval timer
            ;1935 ;  TBER0    to disable the TB
            ;1936 ;  SBI.MAINT to    0
            ;1937 ;  SBI.ERR    to 0
            ;1938 ;  FAULT    to 0
            ;1939 ;  COMP    to 0
            ;1940 ;  RC[0E]    to  0
            ;1941 ;  R[0F]    to 0
            ;1942 ; It also performs an SBI UNJAM and disables the CACHE.
            ;1943 ; A SCOPE call is then made to the Monitor.
            ;1944 ;

;2265  .PAGE
;2266  .TOC "   START TEST"
;2267 ;*************************************************************
;2268 ;**
;2269 ;
;2270 ; Functional Description:
;2271 ; ---------------------
;2272 ;
;2273 ;         This subroutine will be called by all tests that  check  the
;2274 ;    controllers,  or  those  tests  that  have  to switch between the
;2275 ;    controllers when executing.   Its  main  functions  are:   select
;2276 ;    both  controllers  on the MS780-E/H SBI Interface and execute the
;2277 ;    test that called it, call out an error  if  neither  one  of  the
;2278 ;    controllers can be configured properly, if all the controllers on
;2279 ;    a MS780-E/H were configured and tested, it should select the next
;2280 ;    MS780-E/H on the SBI and repeat the above sequence.
;2281 ;    A test making use of this  subroutine  should  be  configured  as
;2282 ;    follows:
;2283 ;
;2284 ;
;2285 ;       Begin TEST.XX
;2286 ;       :
;2287 ;       :   Call NEWTST
;2288 ;       :   Call FIND.MS780E
;2289 ;       :   IF No MS780-E's on the SBI
;2290 ;       :     THEN
;2291 ;       :         Skip to End of TEST.XX
;2292 ;       :     ELSE
;2293 ;       :
;2294 ;       : RESTART.TEST.XX:
;2295 ;       :
;2296 ;       :   Call START TEST
;2297 ;       :   IF Return1 from START.TEST
;2298 ;       :     THEN
;2299 ;       :         Skip to End of TEST.XX
;2300 ;       :     ELSE.
;2301 ;       :
;2302 ;       ~
;2303 ;       ~
;2304 ;       :
;2305 ;       :   Body of TEST.XX
;2306 ;       :
;2307 ;       ~
;2308 ;       ~
;2309 ;       :   Jump RESTART.TEST.XX
;2310 ;       :
;2311 ;      End TEST.XX
;2312 ;
;2313 ;
;2314 ;         This subroutine makes use of a pointer  in  ID  Register  39
;2315 ;    (Temporary  Register  9)  to  "remember"  at  which point control
;2316 ;    should be passed when the subroutine is called a second, third or
;2317 ;    fourth  time, depending on the number of MS780-E's on the SBI and
;2318 ;    the numbers of controllers on each.  (Note:  Temporary Register 9
;2319 ;    will  be  cleared  by  the  NEWTST subroutine.) The pointer in ID
```

```
;2320 ;    Register 39 can be interpreted as follows:
;2321 ;
;2322 ;     b00   -   Value that ID Reg 39 should hold when the subroutine is
;2323 ;               called the first time.  When this code is encountered
;2324 ;               this subroutine will try to select the lower controller.
;2325 ;               If the lower controller is misconfigured, the pointer in
;2326 ;               ID Reg 39  is changed to b01 (See below) and the subroutine
;2327 ;               is re-entered.
;2328 ;               If, however there is no misconfiguration, the value in
;2329 ;               ID Reg 39 is changed to b10 and a Return2 is made to the
;2330 ;               calling test.
;2331 ;
;2332 ;    b01  -     This value signifies that an attempt at configuring the
;2333 ;               lower controller failed, and the subroutine will attempt
;2334 ;               to select the upper controller.
;2335 ;               If the upper controller is also misconfigured execution
;2336 ;               stops with a call to ERROR1.
;2337 ;               If there is no misconfiguration on this controller, then
;2338 ;               the code in ID Reg 39 is changed to b11 and a Return2 is
;2339 ;               made to the calling test.
;2340 ;
;2341 ;    b10  -     This value signifies that the lower controller was selected
;2342 ;               previously and the test was executed once.  If the
;2343 ;               subroutine is entered with this code in ID Reg 39, ID Reg
;2344 ;               39 is loaded with b11 and an attempt is made to select the
;2345 ;               upper controller.
;2346 ;               If there is a misconfiguration on this controller, this
;2347 ;               subroutine is just re-entered.
;2348 ;               Otherwise, a Return2 will be made to the calling test.
;2349 ;
;2350 ;    b11   -    This code identifies the cases in which the test has
;2351 ;               been executed at least once (i.e., at least one of the
;2352 ;               controllers on the MS780-E unit under test could be
;2353 ;               configured properly).  When this code is detected the
;2354 ;               subroutine clears ID Reg 39 and makes a call to
;2355 ;               ENABLE.NEXT.MS780E.  If all MS780-E units have been
;2356 ;               tested then the subroutine executes a Return1.
;2357 ;               Otherwise the subroutine is re-entered.
;2358 ;
;2359 ;
;2360 ; Calling Constraint: =00
;2361 ; ------------------
;2362 ;
;2363 ;
;2364 ; Inputs:
;2365 ; ------
;2366 ;
;2367 ; ID Register 39 must be cleared by NEWTST
;2368 ;
;2369 ;
;2370 ; Outputs:
;2371 ; -------
;2372 ;
;2373 ; RC[0E] will have the I/O Base address of MS780-E/H to be tested
;2374 ; RC[0D] will be set up with the CNFG Register C/D of Controller

            ;2827  .TOC "   FIND MS780-E MEMORY"
            ;2828 ;++
            ;2829 ; FUNCTIONAL DESCRIPTION:
            ;2830 ;
            ;2831 ;          The diagnostic is designed to handle up to 4 (four)
            ;2832 ;     MS780-E/H's on the 780 SBI.  This routine looks at all TR levels
            ;2833 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2834 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2835 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2836 ;     MS780-E/H's found minus one. Also, it is to be noted that the
            ;2837 ;     first MS780-E found will have its starting address set to 0
            ;2838 ;     (zero).
            ;2839 ;     All the other MS780-E/H's found will have their starting address
            ;2840 ;     set to all ones.  Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2841 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2842 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2843 ;     current MS780-E unit under test.
            ;2844 ;     If any of:  MS780-A, MS780-C or MA780 is found, its address is
            ;2845 ;     set to maximum.

            ;3026  .PAGE
            ;3027  .TOC "   ENABLE NEXT MS780-E"
            ;3028 ;++
            ;3029 ; FUNCTIONAL DESCRIPTION:
            ;3030 ;
            ;3031 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;3032 ;    They will be tested  separately, according to the TR level at which
            ;3033 ;    they are located,  starting with the one  at the lowest level first.
            ;3034 ;          When  a test has finished  with the first unit, it will have to call
            ;3035 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;3036 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;3037 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;3038 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;3039 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;3040 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;3041 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;3042 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;3043 ;    as  a  pointer  to  ID  registers 3A through 3D.

;3175  .PAGE "TEST 1AD SINGLE STATE SBI INTERFACE REFERENCES"
;3176 ;++
;3177 ; Functional Description:
;3178 ; ---------------------
;3179 ;
;3180 ; This test checks whether the SBI Interface can perfrom write/read
;3181 ; operations while the CPU is in Single Time State Mode.
;3182 ;
;3183 ;   Subtest 1
;3184 ;
;3185 ; The Data Latches are written with a test pattern while the CPU is being
;3186 ; single stepped by the LSI-11.  A normal read is performed to check data
;3187 ; integrity.
;3188 ;
;3189 ;   Subtest 2
;3190 ;
;3191 ; A normal write operation is made to the Data Latches.  A Read will
;3192 ; follow with the CPU being single stepped, and the data retreived will
;3193 ; be check for errors.
;3194 ;
;3195 ; ----------------
;3196 ;
;3197 ;
;3198 ; Error Logout:
;3199 ; ------------
;3200 ;

;3493  .PAGE "TEST 1AE SINGLE TIME STATE ARRAY/SBI INTERFACE REF."
;3494 ;
;3495 ;*****************************************************************************
;3496 ;++
;3497 ; Functional Description:
;3498 ; ----------------------
;3499 ;
;3500 ; This test makes use of a routine executing in the monitor (on the
;3501 ; LSI-11) to single step the CPU.  Its main function is to verify that
;3502 ; array references are executed properly when the CPU is in the single
;3503 ; step mode.  No interrupts or uTraps are expected.  The following
;3504 ; functions are checked:
;3505 ;
;3506 ;    i.  Memory Write
;3507 ;   ii.  Memory Read
;3508 ;  iii.  Interlocked Write
;3509 ;   iv.  Interlocked Read
;3510 ;
;3511 ;   Subtest 1
;3512 ;
;3513 ; This subtest writes some data pattern to the array in Single CPU State.
;3514 ; The write is followed by a 'normal' read operation to check the
;3515 ; integrity of the data.
;3516 ;
;3517 ;   Subtest 2
;3518 ;
;3519 ; This subtest initializes the array to some known data pattern and then
;3520 ; executes a read cycle in single CPU state.  The data returned is
;3521 ; checked for integrity against the original pattern.
;3522 ;
;3523 ;   Subtest 3
;3524 ;
;3525 ; This subtest is similar to Subtest 1, except that the memory cycle will
;3526 ; be an interlock write.  The array will be initialized with an Interlock
;3527 ; Read to avoid generating a Interlock Sequence Fault.
;3528 ;
;3529 ;   Subtest 4
;3530 ;
;3531 ; This subtest is similar to Subtest 2, except that the memory cycle
;3532 ; executed in Single CPU State will be an Interlock Read.
;3533 ;
;3534 ; -----------------
;3535 ;
;3536 ;
;3537 ; Error Logout:

;4070  .PAGE  TEST 1AF SINGLE BUS STATE SBI INTERFACE REFERENCES
;4071 ;
;4072 ;*****************************************************************************
;4073 ;++
;4074 ; Functional Description:
;4075 ; ----------------------
;4076 ;
;4077 ; This test checks whether the SBI Interface can perfrom write/read
;4078 ; operations in Single BUS Cycle mode.
;4079 ;
;4080 ;   Subtest 1
;4081 ;
;4082 ; The Data Latches are written with a test pattern while the CPU is being
;4083 ; single stepped by the LSI-11.  A normal read is performed to check data
;4084 ; integrity.
;4085 ;
;4086 ;   Subtest 2
;4087 ;
;4088 ; A normal write operation is made to the Data Latches.  A Read will
;4089 ; follow with the CPU being single cycled, and the data retreived will
;4090 ; be check for errors.
;4091 ;
;4092 ; -----------------
;4093 ;

```
;4391  .PAGE "TEST 1B0 SINGLE BUS STATE ARRAY/SBI INTERFACE REF.'
;4392 ;
;4393 ;*******************************************************************************
;4394 ;++
;4395 ; Functional Description:
;4396 ; ----------------------
;4397 ;
;4398 ; This test makes use of a routine executing in the monitor (on the
;4399 ; LSI-11) to single cycle the CPU.  Its main function is to verify that
;4400 ; array references are executed properly when the CPU is in the single
;4401 ; BUS mode.  No interrupts or uTraps are expected.  The following
;4402 ; functions are checked:
;4403 ;
;4404 ;    i.  Memory Write
;4405 ;   ii.  Memory Read
;4406 ;  iii.  Interlocked Write
;4407 ;   iv.  Interlocked Read
;4408 ;
;4409 ;   Subtest 1
;4410 ;
;4411 ; This subtest writes some data pattern to the array in Single CPU State.
;4412 ; The write is followed by a 'normal' read operation to check the
;4413 ; integrity of the data.
;4414 ;
;4415 ;   Subtest 2
;4416 ;
;4417 ; This subtest initializes the array to some known data pattern and then
;4418 ; executes a read cycle in single Bus state.  The data returned is
;4419 ; checked for integrity against the original pattern.
;4420 ;
;4421 ;   Subtest 3
;4422 ;
;4423 ; This subtest is similar to Subtest 1, except that the memory cycle will
;4424 ; be an interlock write.  The array will be initialized with an Interlock
;4425 ; Read to avoid generating a Interlock Sequence Fault.
;4426 ;
;4427 ;   Subtest 4
;4428 ;
;4429 ; This subtest is similar to Subtest 2, except that the memory cycle
;4430 ; executed in Single Bus State will be an Interlock Read.
;4431 ;

;1808 ;*****************************************************************************
;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR47
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:
;1834 ;
;1835 ; MODIFIED BY:
;1836 ;
;1837 ;  1.1 March 10, 1983  Paul Hakala
;1838 ;   Modified the GET.MEMORY.SIZE routine to calculate
;1839 ;   the correct memory address when 256k ram chips are
;1840 ;   present.
;1841 ;
;1842 ;
;1843 ;

;1849
;1850  .TOC " Micro Trap Handler and LSI-11 Support Routines"
;1851  .TOC "   Micro Trap Handler"
;1852 ;++
;1853 ; FUNCTIONAL DESCRIPTION:
;1854 ;
;1855 ; This routine is responsible for 'catching' micro-traps
;1856 ; and reporting unexpected traps to the Monitor. Register R[0F]
;1857 ; contains the Trap-Expected Mask. If the specified bit is set in
;1858 ; the mask, the bit is cleared and a RETURN0 is made otherwise,
;1859 ; an error call is made.
;1860 ;
;1861 ; INPUT PARAMETERS:
;1862 ;
;1863 ; R[0F] - Expected Trap Mask
;1864 ;  Trap Code Function
;1865 ;  ---------      --------
;1866 ;       0  System Init
;1867 ;       1  Data Unaligned
;1868 ;       2  Cross Page
;1869 ;       3  TB Modify
;1870 ;       4  TB Protection
;1871 ;       6  TB Miss
;1872 ;       7  TB Parity
;1873 ;       8  Cache Parity
;1874 ;       9  Reserved Floating Operand
;1875 ;       C  Read Data Substitute
;1876 ;       D  Time out
;1877 ;       F  Control Store Parity Error
;1878 ;      10  Odd Address
;1879 ;
;1880 ; OUTPUT PARAMETERS:
;1881 ;
;1882 ; R[0F] - Mask bit is cleared.

;2272  .PAGE
;2273  .TOC "   START TEST"
;2274 ;*************************************************************
;2275 ;++
;2276 ;
;2277 ; Functional Description:
;2278 ; ----------------------
;2279 ;
;2280 ;         This subroutine will be called by all tests that  check  the
;2281 ;    controllers,  or  those  tests  that  have  to switch between the
;2282 ;    controllers when executing.   Its  main  functions  are:   select
;2283 ;    both  controllers  on the MS780-E/H SBI Interface and execute the
;2284 ;    test that called it, call out an error  if  neither  one  of  the
;2285 ;    controllers can be configured properly, if all the controllers on
;2286 ;    a MS780-E/H were configured and tested, it should select the next
;2287 ;    MS780-E/H on the SBI and repeat the above sequence.
;2288 ;    A test making use of this  subroutine  should  be  configured  as
;2289 ;    follows:
;2290 ;
;2291 ;
;2292 ;       Begin TEST.XX
;2293 ;       :
;2294 ;       :   Call NEWTST
;2295 ;       :   Call FIND.MS780E
;2296 ;       :   IF No MS780-E's on the SBI
;2297 ;       :     THEN
;2298 ;       :         Skip to End of TEST.XX
;2299 ;       :     ELSE
;2300 ;       :
;2301 ;       : RESTART.TEST.XX:
;2302 ;       :
;2303 ;       :   Call START TEST
;2304 ;       :   IF Return1 from START.TEST
;2305 ;       :     THEN
;2306 ;       :         Skip to End of TEST.XX
;2307 ;       :     ELSE.
;2308 ;       :
;2309 ;       ~
;2310 ;       ~
;2311 ;       :
;2312 ;       :   Body of TEST.XX
;2313 ;       :
;2314 ;       ~
;2315 ;       ~
;2316 ;       :   Jump RESTART.TEST.XX
;2317 ;       :
;2318 ;       End TEST.XX
;2319 ;
;2320 ;
;2321 ;         This subroutine makes use of a pointer  in  ID  Register  39
;2322 ;    (Temporary  Register  9)  to   remember   at  which point control
;2323 ;    should be passed when the subroutine is called a second, third or
;2324 ;    fourth  time, depending on the number of MS780-E's on the SBI and
;2325 ;    the numbers of controllers on each.  (Note:  Temporary Register 9
;2326 ;    will  be  cleared  by  the  NEWTST subroutine.) The pointer in ID
```

```
;2327 ;    Register 39 can be interpreted as follows:
;2328 ;
;2329 ;     b00   -   Value that ID Reg 39 should hold when the subroutine is
;2330 ;               called the first time.  When this code is encountered
;2331 ;               this subroutine will try to select the lower controller.
;2332 ;               If the lower controller is misconfigured, the pointer in
;2333 ;               ID Reg 39  is changed to b01 (See below) and the subroutine
;2334 ;               is re-entered.
;2335 ;               If, however there is no misconfiguration, the value in
;2336 ;               ID Reg 39 is changed to b10 and a Return2 is made to the
;2337 ;               calling test.
;2338 ;
;2339 ;     b01   -   This value signifies that an attempt at configuring the
;2340 ;               lower controller failed, and the subroutine will attempt
;2341 ;               to select the upper controller.
;2342 ;               If the upper controller is also misconfigured execution
;2343 ;               stops with a call to ERROR1.
;2344 ;               If there is no misconfiguration on this controller, then
;2345 ;               the code in ID Reg 39 is changed to b11 and a Return2 is
;2346 ;               made to the calling test.
;2347 ;
;2348 ;     b10   -   This value signifies that the lower controller was selected
;2349 ;               previously and the test was executed once.  If the
;2350 ;               subroutine is entered with this code in ID Reg 39, ID Reg
;2351 ;               39 is loaded with b11 and an attempt is made to select the
;2352 ;               upper controller.
;2353 ;               If there is a misconfiguration on this controller, this
;2354 ;               subroutine is just re-entered.
;2355 ;               Otherwise, a Return2 will be made to the calling test.
;2356 ;
;2357 ;     b11   -   This code identifies the cases in which the test has
;2358 ;               been executed at least once (i.e., at least one of the
;2359 ;               controllers on the MS780-E unit under test could be
;2360 ;               configured properly).  When this code is detected the
;2361 ;               subroutine clears ID Reg 39 and makes a call to
;2362 ;               ENABLE.NEXT.MS780E.  If all MS780-E units have been
;2363 ;               tested then the subroutine executes a Return1.
;2364 ;               Otherwise the subroutine is re-entered.
;2365 ;
;2366 ;
;2367 ; Calling Constraint: =00
;2368 ; ------------------
;2369 ;
;2370 ;
;2371 ; Inputs:
;2372 ; ------
;2373 ;
;2374 ; ID Register 39 must be cleared by NEWTST
;2375 ;
;2376 ;
;2377 ; Outputs:
;2378 ; -------
;2379 ;
;2380 ; RC[0E] will have the I/O Base address of MS780-E/H to be tested
;2381 ; RC[0D] will be set up with the CNFG Register C/D of Controller

            ;3117  .PAGE
            ;3118  .TOC "   ENABLE NEXT MS780-E"
            ;3119 ;++
            ;3120 ; FUNCTIONAL DESCRIPTION:
            ;3121 ;
            ;3122 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;3123 ;    They will be tested  separately, according to the TR level at which
            ;3124 ;    they are located,  starting with the one  at the lowest level first.
            ;3125 ;          When  a test has finished  with the first unit, it will have to call
            ;3126 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;3127 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;3128 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;3129 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;3130 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;3131 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;3132 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;3133 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;3134 ;    as  a  pointer  to  ID  registers 3A through 3D.

;3170  .TOC "    FIND CONTROLLERS"
;3171 ;
;3172 ;////////////////////////////////////////////////////////////////////////////
;3173 ;++
;3174 ;
;3175 ; Functional Description:
;3176 ; ----------------------
;3177 ;
;3178 ;
;3179 ;      This subroutine is called by tests that need to know how
;3180 ; many  controllers  are available on the MS780-E/H currently under
;3181 ; test.  It makes use of subroutine SELECT.CNTRLR to put the
;3182 ; controllers in different Interleave Modes.
;3183 ; The subroutine returns control to the calling routine by either
;3184 ; one of:   Return1, Return2, Return3 or Return4.  It is up to the
;3185 ; test to decode this information as necessary.
;3186 ; Since some Tests require this feature, the subroutine also finds
;3187 ; the memory size available on each controller and leaves it in
;3188 ; registers R[0] and R[1].
;3189 ;
;3190 ;

;4176  .PAGE "TEST 1B4 INTERLEAVE MEMORY SIZING TEST"
;4177 ;*************************************************************
;4178 ;+++
;4179 ;
;4180 ; Functional Description:
;4181 ; ---------------------
;4182 ;
;4183 ; This sequence of subtests is intended to check the operation of the
;4184 ; memory sizing function of the SBI Interface.  It places the controllers
;4185 ; in all possible interleave modes and checks how the memory size field
;4186 ; changes (bits <14:9>) in CNFG register A).
;4187 ;
;4188 ;   [Subtest 1:]
;4189 ;
;4190 ; This subtest starts out by finding whether there are two controllers
;4191 ; present.  If there are, they are set to Internal Interleave Mode and
;4192 ; tests are made on the misconfiguration bits (CNFG A - bits <17:15>) and
;4193 ; the memory size bits (CNFG A - bits <14:09>).  After the total size
;4194 ; of the memory is found in interleave mode, the two controllers are set
;4195 ; to Non-Interleaved mode and a check is made to see that the size of the
;4196 ; memory available to each controller is half the total.
;4197 ;
;4198 ;   [Subtest 2:]
;4199 ;
;4200 ; In this subtest the lower controller is set to External Interleaving
;4201 ; and a check is made of the misconfiguration and size bits in CNFG A
;4202 ; (no misconfiguration is expected and teh size should be double the
;4203 ; non-interleaved size).  If the lower controller is not present this
;4204 ; subtest is skipped.
;4205 ;
;4206 ;   [Subtest 3:]
;4207 ;
;4208 ; This subtest is a repeat of the previous one, except that this time the
;4209 ; upper controller is set to External Interleaving.  If no upper
;4210 ; controller is present this subtest is skipped.
;4211 ;
;4212 ; -----------------
;4213 ;
;4214 ;
;4215 ; Error Logout:
;4216 ; ------------
;4217 ;
;4218 ; See individual error reports.

;1808 ;*****************************************************************************
;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR48
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:
;1834 ;
;1835 ; MODIFIED BY:
;1836 ;
;1837 ;  1.1 March 10, 1983  Paul Hakala
;1838 ;   Modified the GET.MEMORY.SIZE routine to calculate
;1839 ;   the correct memory address when 256k ram chips are
;1840 ;   present.
;1841 ;
;1842 ;   Removed the LOAD.TEMP.REGS routine which isn't
;1843 ;   needed in the overlay.
;1844 ;
;1845 ;
;1846 ;
;1847 ;
;1848 ;*****************************************************************************

;1852  .TOC " Micro Trap Handler and LSI-11 Support Routines"
;1853  .TOC "    Micro Trap Handler"
;1854 ;++
;1855 ; FUNCTIONAL DESCRIPTION:
;1856 ;
;1857 ; This routine is responsible for 'catching' micro-traps
;1858 ; and reporting unexpected traps to the Monitor. Register R[0F]
;1859 ; contains the Trap-Expected Mask. If the specified bit is set in
;1860 ; the mask, the bit is cleared and a RETURN0 is made otherwise,
;1861 ; an error call is made.
;1862 ;
;1863 ; INPUT PARAMETERS:
;1864 ;
;1865 ; R[0F] - Expected Trap Mask
;1866 ;  Trap Code Function
;1867 ;  ---------      --------
;1868 ;       0  System Init
;1869 ;       1  Data Unaligned
;1870 ;       2  Cross Page
;1871 ;       3  TB Modify
;1872 ;       4  TB Protection
;1873 ;       6  TB Miss
;1874 ;       7  TB Parity
;1875 ;       8  Cache Parity
;1876 ;       9  Reserved Floating Operand
;1877 ;       C  Read Data Substitute
;1878 ;       D  Time out
;1879 ;       F  Control Store Parity Error
;1880 ;      10  Odd Address
;1881 ;
;1882 ; OUTPUT PARAMETERS:
;1883 ;
;1884 ; R[0F] - Mask bit is cleared.
;1885 ;

            ;2628  .TOC "   FIND MS780-E MEMORY"
            ;2629 ;++
            ;2630 ; FUNCTIONAL DESCRIPTION:
            ;2631 ;
            ;2632 ;          The diagnostic is designed to handle up to 4 (four)
            ;2633 ;     MS780-E/H's on the 780 SBI. This routine looks at all TR levels
            ;2634 ;     for a MS780-E memory unit.  Upon return, ID registers 3A through
            ;2635 ;     3D will hold the I/O base address of the MS780-E subsystems found
            ;2636 ;     on the SBI, and ID Register 3E will hold the Total number of
            ;2637 ;     MS780-E/H's found minus one. Also, it is to be noted that the
            ;2638 ;     first MS780-E found will have its starting address set to 0
            ;2639 ;     (zero).
            ;2640 ;     All the other MS780-E/H's found will have their starting address
            ;2641 ;     set to all ones. Subroutine ENABLE.NEXT.MS780E will look at ID
            ;2642 ;     Reg 3E to decide if there are any more MS780-E and will take
            ;2643 ;     apropriate action.  Register RC[0E] is used as a pointer to the
            ;2644 ;     current MS780-E unit under test.
            ;2645 ;     If any of: MS780-A, MS780-C or MA780 is found, its address is
            ;2646 ;     set to maximum.

            ;2830  .TOC     ENABLE NEXT MS780-E
            ;2831 ;++
            ;2832 ; FUNCTIONAL DESCRIPTION:
            ;2833 ;
            ;2834 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;2835 ;    They will be tested  separately, according to the TR level at which
            ;2836 ;    they are located,  starting with the one  at the lowest level first.
            ;2837 ;          When  a test has finished  with the first unit, it will have to call
            ;2838 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;2839 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;2840 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;2841 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;2842 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;2843 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;2844 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;2845 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;2846 ;    as  a  pointer  to  ID  registers 3A through 3D.

;3675  .PAGE
;3676  .TOC "    FIND CONTROLLERS"
;3677 ;*************************************************************
;3678 ;++
;3679 ;
;3680 ; Functional Description:
;3681 ; ----------------------
;3682 ;
;3683 ;
;3684 ;      This subroutine is called by tests that need to know how
;3685 ; many  controllers  are available on the MS780-E/H currently under
;3686 ; test.  It makes use of subroutine SELECT.CNTRLR to put the
;3687 ; controllers in different Interleave Modes.
;3688 ; The subroutine returns control to the calling routine by either
;3689 ; one of:  Return1, Return2, Return3 or Return4.  It is up to the
;3690 ; test to decode this information as necessary.
;3691 ; Since some Tests require this feature, the subroutine also finds
;3692 ; the memory size available on each controller and leaves it in
;3693 ; registers R[0] and R[1].
;3694 ;
;3695 ;
;3696 ; Calling Constraint: =000
;3697 ; ------------------
;3698 ;
;3699 ;
;3700 ; Inputs:
;3701 ; ------
;3702 ;
;3703 ; RC[0E] MUST HOLD THE I/O BASES ADDRESS OF THE MS780-E/H
;3704 ; UNDER TEST
;3705 ;
;3706 ; Outputs:
;3707 ; -------
;3708 ;
;3709 ; - Return1, Return2, Return3 or Return4 depending on
;3710 ;   how many Controllers were found
;3711 ;
;3712 ; - R[0] Size of Memory on the Lower Controller
;3713 ;   R[1] Size of Memory on the Upper Controller
;3714 ;
;3715 ; Side Effects:
;3716 ; ------------
;3717 ;
;3718 ; The contents of the following registers will be lost:
;3719 ;
;3720 ; D, Q, SC, R[0], R[1]
;3721 ;

```

```
;3756  .PAGE "TEST 1B7 CONTROLLER SELECTION"
;3757 ;*************************************************************
;3758 ;+++
;3759 ;
;3760 ; Functional Description:
;3761 ; ---------------------
;3762 ;
;3763 ; This test will check the controller selection logic.  It will place the
;3764 ; controllers in all possibile interleave modes and will write unique
;3765 ; data in location 0.
;3766 ;
;3767 ; This test, as well as some of the folowing tests, make use of Reed-
;3768 ; Muller codes which allow for a few bits in error in the data stored on
;3769 ; the array.  These codes are being generated by subroutine ENCODE and
;3770 ; decoded by the subroutine DECODE.
;3771 ;
;3772 ; In any of the following tests up to 6 addressing errors are allowed, in
;3773 ; which case the error data will be retreived from ID registers 24
;3774 ; through 30 and will be placed in RC registers x0C through x00.  This
;3775 ; will be accomplished by a subroutine ERDAT which is defined in the
;3776 ; current micro2.
;3777 ;
;3778 ;   [Subtest 1:]
;3779 ;
;3780 ; This subtest first places the lower controller in the Non-Interleaved
;3781 ; mode and writes an encoded test pattern to location 0.  The controller
;3782 ; is then placed in the Externally Interleaved Mode and the integrity of
;3783 ; location 0 ( or 8 depending on the TR level) is checked.  Still in
;3784 ; Externally Interleaved Mode a different encoded pattern is written to
;3785 ; location 0.  The controller is then put back in Non-Interleaved Mode
;3786 ; and the integrity of location 0 is checked.  It is expected that no
;3787 ; micro traps or Interrupts will occur and the data is written correctly
;3788 ; on the array.  The only Time-Out is expected when operating in
;3789 ; Externally Interleaved Mode and a non existent location is accessed.
;3790 ;
;3791 ;   [Subtest 2:]
;3792 ;
;3793 ; This subtest is basically the same as the previous one, except that the
;3794 ; Upper Controller is tested.  Note:  If one of the Controllers is
;3795 ; missing then only the test partaining to the specific controller will
;3796 ; be executed and the other will be skipped.
;3797 ;
;3798 ;   [Subtest 3:]
;3799 ;
;3800 ; This subtest places the controllers in the internally interleaved mode.
;3801 ; Different encoded data patterns are written to locations 0 and 8.  The
;3802 ; controllers are then placed in non-interleave mode and locations 0 on
;3803 ; both controllers are read and checked for data integrity.  Still in
;3804 ; non-interleaved mode different encoded data patterns are written to
;3805 ; location 0 of each controller.  Placing the controllers in internally
;3806 ; interleaved mode the data from locations 0 and 8 is check for
;3807 ; integrity.
;3808 ;
;3809 ;
;3810 ;

;1808 ;*****************************************************************************
;1809 ;
;1810 ;
;1811 ; MODULE NAME: ESKAR49
;1812 ;
;1813 ; CREATION DATE:  SEPTEMBER 1982
;1814 ; AUTHOR:  DAN GRIGORE
;1815 ;
;1816 ; PLEASE INCLUDE DETAILED DESCRIPTION ON THE FOLLOWING ITEMS:
;1817 ;
;1818 ; -  TEST NUMBER ON WHICH CHANGES WERE MADE
;1819 ;
;1820 ; -  WHAT CHANGE WAS MADE
;1821 ;
;1822 ; -  WHY WAS THE CHANGE MADE (INCLUDE DATA ON THE AIDS REPORT
;1823 ;    THAT PROMPTED THE CHANGE IF APLICABLE)
;1824 ;
;1825 ; -  EDIT NUMBER (SEE ESKAR3C FOR MORE DETAILS ON THIS)
;1826 ;    NOTE:  THE EDIT NUMBER IN THIS MODULE HEADER MUST
;1827 ;           MATCH  THE  EDIT  NUMBER FOR THE CHANGE IN
;1828 ;    ESKAR3C).   MAKE SURE  THAT WHEN  MAKING A
;1829 ;    CHANGE  ALL  THE  INFORMATION  REQUIRED IS
;1830 ;    INCLUDED BOTH IN  THE MODULE HEADER AND IN
;1831 ;    ESKAR3C.
;1832 ;
;1833 ; START OF REVISION HISTORY:
;1834 ;
;1835 ; MODIFIED BY:
;1836 ;
;1837 ;  1.1 March 10, 1983  Paul Hakala
;1838 ;   Modified the GET.MEMORY.SIZE routine to calculate
;1839 ;   the correct memory address when 256k ram chips are
;1840 ;   present.
;1841 ;
;1842 ;   March 10, 1983  Paul Hakala
;1843 ;   Removed  the LOAD.TEMP.REG routine that wasn't
;1844 ;   needed in overlay.
;1845 ;
;1846 ;
;1847 ;
;1848 ;*****************************************************************************

;1852  .TOC " Micro Trap Handler and LSI-11 Support Routines"
;1853  .TOC "   Micro Trap Handler"
;1854 ;++
;1855 ; FUNCTIONAL DESCRIPTION:
;1856 ;
;1857 ; This routine is responsible for 'catching' micro-traps
;1858 ; and reporting unexpected traps to the Monitor. Register R[0F]
;1859 ; contains the Trap-Expected Mask. If the specified bit is set in
;1860 ; the mask, the bit is cleared and a RETURN0 is made otherwise,
;1861 ; an error call is made.
;1862 ;
;1863 ; INPUT PARAMETERS:
;1864 ;
;1865 ; R[0F] - Expected Trap Mask
;1866 ;  Trap Code Function
;1867 ;  ---------      --------
;1868 ;       0  System Init
;1869 ;       1  Data Unaligned
;1870 ;       2  Cross Page
;1871 ;       3  TB Modify
;1872 ;       4  TB Protection
;1873 ;       6  TB Miss
;1874 ;       7  TB Parity
;1875 ;       8  Cache Parity
;1876 ;       9  Reserved Floating Operand
;1877 ;       C  Read Data Substitute
;1878 ;       D  Time out
;1879 ;       F  Control Store Parity Error
;1880 ;      10  Odd Address
;1881 ;
;1882 ; OUTPUT PARAMETERS:
;1883 ;
;1884 ; R[0F] - Mask bit is cleared.
;1885 ;
;1886 ; DATA: Micro PC of Micro Trap

;2277  .PAGE
;2278  .TOC "   START TEST"
;2279 ;*************************************************************
;2280 ;**
;2281 ;
;2282 ; Functional Description:
;2283 ; ----------------------
;2284 ;
;2285 ;         This subroutine will be called by all tests that  check  the
;2286 ;    controllers,  or  those  tests  that  have  to switch between the
;2287 ;    controllers when executing.   Its  main  functions  are:   select
;2288 ;    both  controllers  on the MS780-E/H SBI Interface and execute the
;2289 ;    test that called it, call out an error  if  neither  one  of  the
;2290 ;    controllers can be configured properly, if all the controllers on
;2291 ;    a MS780-E/H were configured and tested, it should select the next
;2292 ;    MS780-E/H on the SBI and repeat the above sequence.
;2293 ;    A test making use of this  subroutine  should  be  configured  as
;2294 ;    follows:
;2295 ;
;2296 ;
;2297 ;       Begin TEST.XX
;2298 ;        :
;2299 ;        :   Call NEWTST
;2300 ;        :   Call FIND.MS780E
;2301 ;        :   IF No MS780-E's on the SBI
;2302 ;        :     THEN
;2303 ;        :         Skip to End of TEST.XX
;2304 ;        :     ELSE
;2305 ;        :
;2306 ;        : RESTART.TEST.XX:
;2307 ;        :
;2308 ;        :   Call START TEST
;2309 ;        :   IF Return1 from START.TEST
;2310 ;        :     THEN
;2311 ;        :         Skip to End of TEST.XX
;2312 ;        :     ELSE.
;2313 ;        :
;2314 ;        ~
;2315 ;        ~
;2316 ;        :
;2317 ;        :   Body of TEST.XX
;2318 ;        :
;2319 ;        ~
;2320 ;        ~
;2321 ;        :   Jump RESTART.TEST.XX
;2322 ;        :
;2323 ;       End TEST.XX
;2324 ;
;2325 ;
;2326 ;         This subroutine makes use of a pointer  in  ID  Register  39
;2327 ;    (Temporary  Register  9)  to  "remember   at  which point control
;2328 ;    should be passed when the subroutine is called a second, third or
;2329 ;    fourth  time, depending on the number of MS780-E's on the SBI and
;2330 ;    the numbers of controllers on each.  (Note:  Temporary Register 9
;2331 ;    will  be  cleared  by  the  NEWTST subroutine.) The pointer in ID
```

```
;2332 ;    Register 39 can be interpreted as follows:
;2333 ;
;2334 ;     b00   -   Value that ID Reg 39 should hold when the subroutine is
;2335 ;               called the first time.  When this code is encountered
;2336 ;               this subroutine will try to select the lower controller.
;2337 ;               If the lower controller is misconfigured, the pointer in
;2338 ;               ID Reg 39  is changed to b01 (See below) and the subroutine
;2339 ;               is re-entered.
;2340 ;               If, however there is no misconfiguration, the value in
;2341 ;               ID Reg 39 is changed to b10 and a Return2 is made to the
;2342 ;               calling test.
;2343 ;
;2344 ;    b01  -     This value signifies that an attempt at configuring the
;2345 ;               lower controller failed, and the subroutine will attempt
;2346 ;               to select the upper controller.
;2347 ;               If the upper controller is also misconfigured execution
;2348 ;               stoos with a call to ERROR1.
;2349 ;               If there is no misconfiguration on this controller, then
;2350 ;               the code in ID Reg 39 is changed to b11 and a Return2 is
;2351 ;               made to the calling test.
;2352 ;
;2353 ;    b10  -     This value signifies that the lower controller was selected
;2354 ;               previously and the test was executed once.  If the
;2355 ;               subroutine is entered with this code in ID Reg 39, ID Reg
;2356 ;               39 is loaded with b11 and an attempt is made to select the
;2357 ;               upper controller.
;2358 ;               If there is a misconfiguration on this controller, this
;2359 ;               subroutine is just re-entered.
;2360 ;               Otherwise, a Return2 will be made to the calling test.
;2361 ;
;2362 ;    b11   -    This code identifies the cases in which the test has
;2363 ;               been executed at least once (i.e., at least one of the
;2364 ;               controllers on the MS780-E unit under test could be
;2365 ;               configured properly).  When this code is detected the
;2366 ;               subroutine clears ID Reg 39 and makes a call to
;2367 ;               ENABLE.NEXT.MS780E.  If all MS780-E units have been
;2368 ;               tested then the subroutine executes a Return1.
;2369 ;               Otherwise the subroutine is re-entered.
;2370 ;
;2371 ;
;2372 ; Calling Constraint: =00
;2373 ; ------------------
;2374 ;
;2375 ;
;2376 ; Inputs:
;2377 ; ------
;2378 ;
;2379 ; ID Register 39 must be cleared by NEWTST
;2380 ;
;2381 ;
;2382 ; Outputs:
;2383 ; -------
;2384 ;
;2385 ; RC[0E] will have the I/O Base address of MS780-E/H to be tested
;2386 ; RC[0D] will be set up with the CNFG Register C/D of Controller
```

```

            ;3009  .TOC "    ENABLE NEXT MS780-E"
            ;3010 ;**
            ;3011 ; FUNCTIONAL DESCRIPTION:
            ;3012 ;
            ;3013 ;          This diagnostic will  be able to handle up  to  four  MS780-E units.
            ;3014 ;    They will be tested  separately, according to the TR level at which
            ;3015 ;    they are located,  starting with the one  at the lowest level first.
            ;3016 ;          When  a test has finished  with the first unit, it will have to call
            ;3017 ;    this specific  routine  to see  if any other MS780-E unit is present
            ;3018 ;    on the SBI. If more units are  present, the first one  will be  dis-
            ;3019 ;    abled  by  setting  its  starting  address to maximum, the next unit
            ;3020 ;    will be  enabled  by  setting its starting address to 0 and the test
            ;3021 ;    will be restarted. Subroutine  FIND.MS780E  will  look  on  the  SBI
            ;3022 ;    for  MS780-E/H  subsystems, and will leave their I/O base address in
            ;3023 ;    ID registers 3A through 3D and  a count of the Total number of units
            ;3024 ;    found - 1 in register 3E. In this subroutine the SC register is used
            ;3025 ;    as  a  pointer  to  ID  registers 3A through 3D.

;4043  .TOC "   FIND CONTROLLERS"
;4044 ;*****************************************************
;4045 ;++
;4046 ;
;4047 ; Functional Description:
;4048 ; ---------------------
;4049 ;
;4050 ;
;4051 ;      This subroutine is called by tests that need to know how
;4052 ; many  controllers  are available on the MS780-E/H currently under
;4053 ; test.  It makes use of subroutine SELECT.CNTRLR to put the
;4054 ; controllers in different Interleave Modes.
;4055 ; The subroutine returns control to the calling routine by either
;4056 ; one of:  Return1, Return2, Return3 or Return4.  It is up to the
;4057 ; test to decode this information as necessary.
;4058 ; Since some Tests require this feature, the subroutine also finds
;4059 ; the memory size available on each controller and leaves it in
;4060 ; registers R[0] and R[1].
;4061 ;
;4062 ;
;4063 ; Calling Constraint: =000
;4064 ; ------------------
;4065 ;
;4066 ;

;4165  .PAGE "TEST 1B9 BOARD/BANK SELECT ADDRESSING"
;4166 ;*************************************************************
;4167 ;***
;4168 ;
;4169 ; Functional Description:
;4170 ; ----------------------
;4171 ;
;4172 ;       The following subtests check the addressing lines to the boards on
;4173 ;   each controllers and to the banks on each board.
;4174 ;
;4175 ;       SUBTEST 1 - BOARD SELECT ADDRESSING (Non-Intrlvd)
;4176 ;
;4177 ;      This subtest finds the number of array boards present on each controller
;4178 ; In Non-Interleaved mode, it makes a first pass starting with board 0, writing
;4179 ; encoded 0's  to  location 0  on each board (up to the last existing board).##
;4180 ; Then, the  test  starts  from  board 1  reading out the  data of 0 previously
;4181 ; written.  If it checks out  (i.e., no errors)  a unique  encoded data pattern
;4182 ; is written to address 0 of each board.  Board 0 address location 0 is written
;4183 ; last.  The data is  read out,  starting  with board 0, decoded and checked to
;4184 ; see if matches the expected data (i.e.,  the correct board was addressed both
;4185 ; by reading and writing).
;4186 ;
;4187 ;       SUBTEST 2 - BOARD SELECT ADDRESSING (Ext-Intrlvd)
;4188 ;
;4189 ;       This subtest performs exactly the same test as the previous one, except
;4190 ;  that  in  this case the  controller  under test is placed in the Externally
;4191 ;  Interleaved mode.
;4192 ;
;4193 ;      SUBTEST 3 - BANK SELECT ADDRESSING (Non-Intrlvd)
;4194 ;
;4195 ;      In this subtest the bank select addressing lines are being checked in the
;4196 ;   Non-Interleaved mode.  It starts by writing encoded zeroes to all the banks
;4197 ;   on an array board. Then starting with bank 0 unique encoded data is written
;4198 ;   to location 0 on each bank  after first  checking and making sure that the
;4199 ;   data previously written is still valid.##
;4200 ;   Now, starting with bank 0 the data is retreived, decoded and checked to see
;4201 ;   if it is equal to the expected.
;4202 ;
;4203 ;       SUBTEST 4 - BANK SELECT ADDRESSING (Ext-Intrlvd)
;4204 ;
;4205 ;       This is a repeat of the previous subtest except that the test is
;4206 ;      performed in the externally interleaved mode.
;4207 ;
;4208 ;   The above tests had to be repeated in interleaved and Non-Interleaved Modes
;4209 ;  due to the changes in addressing that take place when changing from one mode
;4210 ;  to the next.
;4211 ;
;4212 ;
;4213 ;
;4214 ;
;4215 ; Logic Description:
;4216 ; -----------------
;4217 ;         Failure of these tests identify problems with the addressing logic on
;4218 ;    the SBI Interface board, the address latches (i.e., RAM Address Queue and
;4219 ; Latch,and Board/Bank Address Queue and Latch) on the controller board, the
```

```
;4220 ; array address drivers or the physical lines connecting them.
;4221 ;
;4222 ;      Please (!) NOTE: in the case of the bank addressing tests the banks will
;4223 ;  be "assigned" consecutive numbers from 1 to some maximum value. This
;4224 ;  maximum  value is dependent on the number of arrays present on the
;4225 ;  controller.## Thus if there were 3 arrays on one controller (upper or lower)
;4226 ;  then the  bank  numbers  will be from 1 to 12, each bank on each array being
;4227 ;  assigned  a unique number.
;4228 ;
;4229 ;       Bank numbers 1 through 4 will be on the first array, banks 5 through 8
;4230 ;   will be  on the  second array and finally banks 9 through 12 will be on the
;4231 ;   third array.##  This numbering scheme is necessary to differentiate between
;4232 ;   the boards in the case of a failure. (A better way would have been to print
;4233 ;   the board number along  with the failing banks on that board.  However this
;4234 ;   is impossible due to  the limited number of registers.)
;4235 ;
;4236 ;
;4237 ; Error Logout:
;4238 ; ------------
;4239 ;
;4240 ; See individual error reports.
;4241 ;
;4242 ; Sync Point Description:
